Type 2 diabetes: Oral (allow several days between dose titrations): Initial: 5 mg/day; adjust dosage at 2.5-5 mg daily increments as determined by blood glucose response at intervals of several days.

Immediate release tablet: Maximum recommended once-daily dose: 15 mg; maximum recommended total daily dose: 40 mg. Doses >15 mg/day should be administered in divided doses.

Extended release tablet (Glucotrol XL®): Maximum recommended dose: 20 mg

When transferring from insulin to glipizide:

Current insulin requirement ≤20 units: Discontinue insulin and initiate glipizide at usual dose

Current insulin requirement >20 units: Decrease insulin by 50% and initiate glipizide at usual dose; gradually decrease insulin dose based on patient response. Several days should elapse between dosage changes.

Dosing: ElderlyInitial: 2.5 mg/day; increase by 2.5-5 mg/day at 1- to 2-week intervals.

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Some investigators recommend not using.

Dosing: Hepatic ImpairmentInitial dosage should be 2.5 mg/day.

Administration: OralAdminister immediate release tablets 30 minutes before a meal to achieve greatest reduction in postprandial hyperglycemia. Extended release tablets should be given with breakfast. Patients who are NPO may need to have their dose held to avoid hypoglycemia.

Dietary ConsiderationsTake immediate release tablets 30 minutes before meals; extended release tablets should be taken with breakfast. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness).

ContraindicationsHypersensitivity to glipizide or any component of the formulation, other sulfonamides; type 1 diabetes mellitus (insulin dependent, IDDM); diabetic ketoacidosis

Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic disease.
- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- GI tract stricture/narrowing: The extended release formulation consists of drug within a nondeformable matrix; following drug release/absorption, the matrix/shell is expelled in the stool. The use of nondeformable products in patients with known stricture/narrowing of the GI tract has been associated with symptoms of obstruction. Avoid use of extended release tablets (Glucotrol® XL) in patients with severe gastrointestinal narrowing or esophageal dysmotility.

Geriatric ConsiderationsGlipizide is a useful agent since there are few drug-to-drug interactions and elimination of the active drug is not dependent upon renal function. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal studies; therefore, glipizide is classified as pregnancy category C. Glipizide crosses the placenta. Severe hypoglycemia lasting 4-10 days has been noted in infants born to mothers taking a sulfonylurea at the time of delivery. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. The manufacturer recommends if glipizide is used during pregnancy it should be discontinued at least 1 month before the expected delivery date. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsData from initial studies note that glipizide was not detected in breast milk. Breast-feeding is not recommended by the manufacturer. Potentially, hypoglycemia may occur in a nursing infant exposed to a sulfonylurea via breast milk.

Pregnancy & Lactation, In-Depth

- GlipiZIDE in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, syncope

Central nervous system: Anxiety, depression, dizziness, drowsiness, headache, hypoesthesia, insomnia, nervousness, pain

Dermatologic: Eczema, erythema, maculopapular eruptions, morbilliform eruptions, photosensitivity, pruritus, rash, urticaria

Endocrine & metabolic: Disulfiram-like reaction, hypoglycemia, hyponatremia, SIADH (rare)

Gastrointestinal: Anorexia, constipation, diarrhea, epigastric fullness, flatulence, gastralgia, heartburn, nausea, vomiting

Hematologic: Agranulocytopenia, aplastic anemia, blood dyscrasias, hemolytic anemia, leukopenia, pancytopenia, porphyria cutanea tarda, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatic porphyria

Neuromuscular & skeletal: Arthralgia, leg cramps, myalgia, paresthesia, tremor

Ocular: Blurred vision

Renal: Diuretic effect (minor)

Respiratory: Rhinitis

Miscellaneous: Diaphoresis

Postmarketing and/or case reports: Abdominal pain

Metabolism/Transport Effects**Substrate** of 2C9 (major)

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol (may cause hypoglycemia or rare disulfiram reaction).

Food: A delayed release of insulin may occur if glipizide is taken with food. Immediate release tablets should be administered 30 minutes before meals to avoid erratic absorption.

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of glipizide. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle

Monitoring ParametersSigns and symptoms of hypoglycemia (fatigue, excessive hunger, profuse sweating, numbness of extremities), blood glucose, hemoglobin A_{1c}

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking, and any allergies they may have. Assess results of laboratory tests, therapeutic effects, and adverse response (eg, hypoglycemia) at regular intervals during therapy. Teach patient proper use (or refer patient to diabetic educator for instruction), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBlood glucose, hemoglobin A_{1c}

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. Monitor glucose as recommended by prescriber. Other important components of treatment plan may include prescribed diet and exercise regimen (consult prescriber or diabetic educator). Always carry quick source of sugar with you. Take exactly as directed. Immediate release tablets should be taken 30 minutes before meals, at the same time each day. Extended release tablets should be taken with breakfast. Do not chew or crush extended release tablets. Do not change dose or discontinue without consulting prescriber. Avoid alcohol while taking this medication; could cause severe reaction. Do not take other medication within 2 hours of this medication unless advised by prescriber. If you experience hypoglycemic reaction, contact prescriber immediately. You may experience more sensitivity to sunlight (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); or headache or nausea (consult prescriber if these persist). Report severe or persistent side effects (eg, hypoglycemia: palpitations, sweaty palms, lightheadedness; extended vomiting; diarrhea or constipation; flu-like symptoms; skin rash; easy bruising or bleeding; or change in color of urine or stool). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg, 10 mg

Glucotrol®: 5 mg, 10 mg

Tablet, extended release: 2.5 mg, 5 mg, 10 mg

Glucotrol XL®: 2.5 mg, 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (GlipiZIDE XL)

2.5 mg (30): $18.99

5 mg (30): $14.99

10 mg (30): $19.99

Tablet, 24-hour (Glucotrol XL)

2.5 mg (30): $27.29

5 mg (30): $27.29

10 mg (30): $41.99

Tablets (GlipiZIDE)

5 mg (100): $19.98

10 mg (90): $19.49

Tablets (Glucotrol)

5 mg (60): $44.09

10 mg (60): $72.44

Mechanism of ActionStimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Pharmacodynamics/Kinetics

Duration: 12-24 hours

Absorption: Rapid and complete; delayed with food

Distribution: 10-11 L

Protein binding: 98% to 99%; primarily to albumin

Bioavailability: 90% to 100%

Metabolism: Hepatic via CYP2C9; forms metabolites (inactive)

Half-life elimination: 2-5 hours

Time to peak: 1-3 hours; extended release tablets: 6-12 hours

Excretion: Urine (60% to 80%, 91% to 97% as metabolites); feces (11%)

Related Information

- Diabetes Mellitus Management, Adults
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentGlipizide-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; phenothiazines and TCAs may antagonize glipizide hypoglycemic effects; MAO inhibitors and TCAs may enhance hypoglycemic effects

Cardiovascular ConsiderationsThe possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium-sensitive ATP channels, has been raised. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS and

ADVANCE, do not reveal any increased cardiovascular mortality.

Index Terms Glydiazinamide

Glucagon

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Glucagon may be confused with Glaucon®

Pronunciation(GLOO ka gon)
U.S. Brand NamesGlucaGen®; GlucaGen® Diagnostic Kit; GlucaGen® HypoKit™; Glucagon Emergency Kit
Pharmacologic CategoryAntidote; Diagnostic Agent
Use: Labeled IndicationsManagement of hypoglycemia; diagnostic aid in radiologic examinations to temporarily inhibit GI tract movement
Use: Unlabeled/InvestigationalUsed with some success as a cardiac stimulant in management of severe cases of beta-adrenergic blocking agent overdosage; treatment of myocardial depression due to calcium channel blocker overdose
Dosing: Adults

Hypoglycemia or insulin shock therapy: I.M., I.V., SubQ: 1 mg; may repeat in 20 minutes as needed

Note: I.V. dextrose should be administered as soon as it is available; if patient fails to respond to glucagon, I.V. dextrose must be given.

Beta-blocker overdose, calcium channel blocker overdose (unlabeled use): I.V.: 5-10 mg over 1 minutes followed by an infusion of 1-10 mg/hour. The following has also been reported for beta-blocker overdose: 3-10 mg or initially 0.5-5 mg bolus followed by continuous infusion 1-5 mg/hour

Diagnostic aid: I.M., I.V.: 0.25-2 mg 10 minutes prior to procedure

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Hypoglycemia or insulin shock therapy: I.M., I.V., SubQ:

Children <20 kg: 0.5 mg or 20-30 mcg/kg/dose; repeated in 20 minutes as needed

Children ≥20 kg: Refer to adult dosing.

Note: I.V. dextrose should be administered as soon as it is available; if patient fails to respond to glucagon, I.V. dextrose must be given.

Administration: I.V.Bolus may be associated with nausea and vomiting. Continuous infusions may be used in beta-blocker overdose/toxicity.
Dietary ConsiderationsAdminister carbohydrates to patient as soon as possible after response to treatment.
StoragePrior to reconstitution, store at controlled room temperature of 20°C to 25° (69°F to 77°F); do not freeze. Use reconstituted solution immediately. May be kept at 5°C for up to 48 hours if necessary.
ReconstitutionReconstitute powder for injection by adding 1 mL of sterile diluent to a vial containing 1 unit of the drug, to provide solutions containing 1 mg of glucagon/mL. Gently roll vial to dissolve. If dose to be administered is <2 mg of the drug, then use only the diluent provided by the manufacturer. If >2 mg, use sterile water for injection.
ContraindicationsHypersensitivity to glucagon or any component of the formulation; insulinoma; pheochromocytoma
Warnings/Precautions

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency; levels of glucose stores in liver may be decreased.
- Chronic hypoglycemia: Use with caution in patients with chronic hypoglycemia; levels of glucose stores in liver may be decreased.
- Insulinoma: Exogenous glucagon may cause an initial rise in blood glucose followed by rebound hypoglycemia. The use of glucagon is contraindicated in patients with this condition.
- Pheochromocytoma: Exogenous glucagon may cause the release of catecholamines, resulting in an increase in blood pressure. The use of glucagon is contraindicated in patients with this condition.
- Starvation/fasting: Use caution with prolonged fasting and/or starvation; levels of glucose stores in liver may be decreased.

Dosage form specific issues:

- Lactose: May contain lactose; avoid administration in hereditary galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption.

Other warnings/precautions:

- Monitoring: Monitor blood glucose levels closely.

- Secondary hypoglycemia: Supplemental carbohydrates should be given to patients who respond to glucagon for severe hypoglycemia to prevent secondary hypoglycemia.

Geriatric ConsiderationsNo specific recommendations needed.
Pregnancy Risk FactorB
LactationExcretion in breast milk unknown/compatible
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension (up to 2 hours after GI procedures), hypertension, tachycardia

Gastrointestinal: Nausea, vomiting (high incidence with rapid administration of high doses)

Miscellaneous: Hypersensitivity reactions, anaphylaxis

Drug Interactions

Vitamin K Antagonists (eg, warfarin): Glucagon may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsGlucagon depletes glycogen stores.
Monitoring ParametersBlood pressure, blood glucose, ECG, heart rate, mentation
Nursing: Physical Assessment/MonitoringArouse patient from hypoglycemic or insulin shock as soon as possible and administer carbohydrates. Evaluate insulin dosage and patient's ability to administer appropriate dose. Instruct patient (or significant other) in appropriate administration procedures for emergency use of glucagon. If home glucose monitoring device is available, check blood sugar as soon as possible.
Monitoring: Lab TestsBlood glucose
Patient EducationIdentify appropriate support person to administer glucagon if necessary. Follow prescribers instructions for administering glucagon. Review diet, insulin administration, and testing procedures with prescriber or diabetic educator.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride:

GlucaGen®: 1 mg [equivalent to 1 unit; contains lactose 107 mg]

GlucaGen® Diagnostic Kit: 1 mg [equivalent to 1 unit; contains lactose 107 mg; packaged with sterile water]

GlucaGen® HypoKit™: 1 mg [equivalent to 1 unit; contains lactose 107 mg; packaged with prefilled syringe containing sterile water]

Glucagon Emergency Kit: 1 mg [equivalent to 1 unit; contains lactose 49 mg; packaged with diluent syringe containing glycerin 12 mg/mL and water for injection]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Kit (Glucagon Emergency)

1 mg (1): $108.01

Solution (reconstituted) (GlucaGen HypoKit)

1 mg (1): $107.01

Mechanism of ActionStimulates adenylate cyclase to produce increased cyclic AMP, which promotes hepatic glycogenolysis and gluconeogenesis, causing a raise in blood glucose levels
Pharmacodynamics/Kinetics

Onset of action: Peak effect: Blood glucose levels: Parenteral:

I.V.: 5-20 minutes

I.M.: 30 minutes

SubQ: 30-45 minutes

Duration: Glucose elevation:

SubQ: 60-90 minutes

I.V.: 30 minutes

Metabolism: Primarily hepatic; some inactivation occurring renally and in plasma

Half-life elimination, plasma: 8-18 minutes

Pharmacotherapy Pearls1 unit = 1 mg
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsGlucagon Hydrochloride

Jump To Field (Select Field Name)

Pronunciation(GLOO ta meen)

U.S. Brand NamesEnterex® Glutapak-10® [OTC]; NutreStore™; Resource® GlutaSolve® [OTC]; Sympt-X G.I. [OTC]; Sympt-X [OTC]

Pharmacologic CategoryAmino Acid

Use: Labeled IndicationsTreatment of short bowel syndrome when used in combination with nutritional support and growth hormone therapy; a medical food used to promote GI tract healing and nutritional supplementation with GI disorders, HIV/AIDS, cancer, and other critical illnesses

Dosing: Adults

Nutritional supplement (Enterex® Glutapak-10®, Resource® GlutaSolve®, Sympt-X, Sympt-X G.I.): Oral: Average dose: 10 g 3 times/day; dosing range: 5-30 g/day

Short bowel syndrome (NutreStore™): Oral: 30 g/day administered as 5 g 6 times/day (every 2-3 hours while awake) for up to 16 weeks; to be used in combination with growth hormone and nutritional support

Dosing: ElderlyRefer to adult dosing.

Administration: Oral

Enterex® Glutapak-10®: Prior to use, mix with clear liquids or semisolid food. If administering via feeding tube, mix each 10 g packet with ≥60 mL water. Use immediately after preparation. May also be added directly to enteral formula if used within 24 hours.

Resource® GlutaSolve®: Mix each 15 g packet with 120-240 mL of water. May also be mixed in hot or cold beverages, applesauce, or pudding. If administering via feeding tube, mix with 60-120 mL water. Use immediately after preparation.

NutreStore™: Mix each packet (5 g) with ~240 mL of water prior to administration. May be given with meals or snacks

Sympt-X, Sympt-X G.I.: Mix dose with 6-8 ounces of juice or another beverage, may also be mixed with applesauce or pudding. Administer with meals. If administering via feeding tube, mix with ≥60 mL water; do not add directly to feeding bag. Use immediately after preparation.

Dietary ConsiderationsNutreStore™: To be used in combination with a specialized diet. May be taken with food or a snack.

StorageStore at controlled room temperature.

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Dosage form specific issues:

- NutreStore™: Should be used with nutritional support based on individual patient requirements.

Other warnings/precautions:

- Appropriate use: Medical foods are intended to be used under the direction of a healthcare provider.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsThe amount of total protein and free amino acids found in breast milk varies during lactation. Effects of the suggested oral dose of glutamine are unknown.

Adverse ReactionsFrequency not defined.

Cardiovascular: Facial edema, peripheral edema

Central nervous system: Dizziness, fever, headache, pain

Dermatologic: Pruritus, rash

Gastrointestinal: Abdominal pain, flatulence, nausea, pancreatitis, tenesmus, vomiting

Neuromuscular & skeletal: Arthralgia, back pain, hypoesthesia

Otic: Ear or hearing symptoms

Respiratory: Rhinitis

Miscellaneous: Flu-like syndrome, infection, sepsis

Monitoring ParametersBUN; body weight, nutritional status

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness according to purpose for use and adverse response (see Adverse Reactions). Teach patient proper use (reconstitution and storage), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBUN

Patient EducationPrepare, store, and use exactly as directed. Do not exceed recommended dosage. May cause increased flatulence, nausea or vomiting, or abdominal pain; if persistent or severe contact prescriber. Report facial or peripheral swelling, rash; unusual back pain; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral solution:

Enterex® Glutapak-10®: 10 g/packet (50s)

NutreStore™: 5 g/packet

Resource® GlutaSolve®: 15 g/packet (56s)

Sympt-X, Sympt-X G.I.: 10 g/packet (60s)

Mechanism of ActionGlutamine regulates gastrointestinal cell growth, function, and regeneration. Considered a “conditionally essential” amino acid during metabolic stress and injury.

Pharmacodynamics/KineticsAs reported in healthy adults; parameters may vary following oral administration in patients with short bowel syndrome.

Distribution: I.V.: V_d: 200 mL/kg

Metabolism: Via splanchnic tissue, lymphocytes, kidney, and liver to glutamate and ammonia

Half-life elimination: I.V.: 1 hour

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Glucovance may be confused with Vyvanse™

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(GLYE byoor ide & met FOR min)

U.S. Brand NamesGlucovance®

Pharmacologic CategoryAntidiabetic Agent, Biguanide; Antidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsAdjunct to diet and exercise for the management of type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Dosing: Adults**Note:** Dose must be individualized. All doses should be taken with a meal. Twice daily dosage should be taken with the morning and evening meals. Dosages expressed as glyburide/metformin components.

Type 2 diabetes: Oral:

No prior treatment with sulfonylurea or metformin: Initial: 1.25 mg/250 mg once daily with a meal; patients with Hb A_{1c} >9% or fasting plasma glucose (FPG) >200 mg/dL may start with 1.25 mg/250 mg twice daily with meals. Adjustment: Dosage may be increased in increments of 1.25 mg/250 mg, at intervals of not less than 2 weeks; maximum daily dose: 10 mg/2000 mg (limited experience with higher doses); **Note:** Doses of 5 mg /500 mg should not be used as initial therapy, due to risk of hypoglycemia.

Previously treated with a sulfonylurea or metformin alone: Initial: 2.5 mg/500 mg or 5 mg/500 mg twice daily with meals; increase in increments no greater than 5 mg/500 mg; maximum daily dose: 20 mg/2000 mg

Note: When switching patients previously on a sulfonylurea and metformin together, do not exceed the daily dose of glyburide (or glyburide equivalent) or metformin. When adding thiazolidinedione, continue glyburide and metformin at current dose and initiate thiazolidinedione at recommended starting dose.

Combination with thiazolidinedione: May be combined with a thiazolidinedione in patients with an inadequate response to glyburide/metformin therapy, however the risk of hypoglycemia may be increased.

Dosing: ElderlyRefer to adult dosing. Adjust carefully to renal function. Should not be used in patients ≥80 years of age unless renal function is verified as normal. Do not titrate to maximum dose.

Administration: OralAll doses should be administered with a meal. Twice-daily dosing should be administered with the morning and evening meals. Patients who are anorexic or NPO may need to have their dose held to avoid hypoglycemia.

Dietary ConsiderationsMay cause GI upset; take with food to decrease GI upset. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness). Monitor for signs and symptoms of vitamin B_{12} deficiency. Monitor for signs and symptoms of folic acid deficiency.

StorageStore at ≤25°C (≤77°F). Protect from light.

ContraindicationsHypersensitivity to glyburide, metformin, or any component of the formulation; renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females, or abnormal creatinine clearance) which may also result from conditions such as cardiovascular collapse, acute myocardial infarction, and septicemia; acute or chronic metabolic acidosis with or without coma (including diabetic ketoacidosis)

Note: Temporarily discontinue in patients undergoing radiologic studies in which intravascular iodinated contrast materials are utilized. Temporarily discontinue for surgical procedures.

Allergy Considerations

- Biguanide Allergy
- Sulfonylurea Allergy

Warnings/Precautions

Boxed warnings:

- Lactic acidosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association. Metformin does not appear to share this risk.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal, hepatic, adrenal and/or pituitary function; use with caution.

- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially fatal and severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is not specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Heart failure: Use metformin with caution in patients with heart failure requiring pharmacologic management, particularly in patients with unstable or acutely decompensated heart failure; risk of lactic acidosis may be increased secondary to hypoperfusion.

- Hepatic impairment: Avoid metformin use in patients with impaired liver function due to potential for lactic acidosis.

- Renal impairment: Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Thiazolidinediones: Concurrent use with a thiazolidinedione may increase risk of hypoglycemia and/or weight gain. Liver function tests should be monitored periodically with concurrent use.

Special populations:

- Elderly: Rapid and prolonged hypoglycemia (>12 hours) despite hypertonic glucose injections have been reported; age and hepatic and renal impairment are independent risk factors for hypoglycemia; dosage titration should be made at weekly intervals. Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism.

- Iodinated contrast: Metformin therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.

- Surgical procedures: Metformin therapy should be suspended for any surgical procedures requiring food or fluid restriction (resume only after normal intake resumed and normal renal function is verified).

Geriatric ConsiderationsConservative doses are recommended in the elderly due to potentially decreased renal function. **Do not titrate to maximum dose**. Should not be used in patients ≥80 years of age unless renal function is verified as normal. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal reproduction studies were not conducted with this combination. Adverse events were not observed in animal studies of the individual agents; therefore, glyburide/metformin is classified as pregnancy category B. Refer to individual agents.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsRefer to individual agents.

Pregnancy & Lactation, In-Depth

- GlyBURIDE in Pregnancy & Lactation
- MetFORMIN in Pregnancy & Lactation

Adverse ReactionsAlso see individual agents.

>10%:

Endocrine & metabolic: Hypoglycemia (11% to 38%, effects higher when increased doses were used as initial therapy)

Gastrointestinal: Diarrhea (17%)

Respiratory: Upper respiratory infection (17%)

1% to 10%:

Central nervous system: Headache (9%), dizziness (6%)

Gastrointestinal: Nausea (8%), vomiting (8%), abdominal pain (7%) (combined GI effects increased to 38% in patients taking high doses as initial therapy)

<1%: Disulfiram-like reactions (rare) reported in patients taking glyburide

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Bosentan: GlyBURIDE may enhance the hepatotoxic effect of Bosentan. GlyBURIDE may increase the metabolism of Bosentan. Bosentan may increase the metabolism of GlyBURIDE. *Risk X: Avoid combination*

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Colesevelam: May decrease the serum concentration of GlyBURIDE. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: May cause hypoglycemia; incidence of lactic acidosis may be increased; a disulfiram-like reaction characterized by flushing, headache, nausea, vomiting, sweating, or tachycardia has been reported with sulfonylureas; avoid or limit use.

Food: Metformin decreases absorption of vitamin B_{12}. Metformin decreases absorption of folic acid.

Monitoring ParametersSigns and symptoms of hypoglycemia, urine for glucose and ketones, FPG, Hb A_{1c}, and fructosamine. Initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit and red blood cell indices) and renal function should be performed; monitor at least annually once patient is on maintenance therapy. While megaloblastic anemia has been rarely seen with metformin, if suspected, vitamin B_{12} deficiency should be excluded.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1.25 mg/250 mg: Glyburide 1.25 mg and metformin hydrochloride 250 mg; 2.5 mg/500 mg: Glyburide 2.5 mg and metformin hydrochloride 500 mg; 5 mg/500 mg: Glyburide 5 mg and metformin hydrochloride 500 mg

Glucovance®: 1.25 mg/250 mg: Glyburide 1.25 mg and metformin hydrochloride 250 mg

Glucovance®: 2.5 mg/500 mg: Glyburide 2.5 mg and metformin hydrochloride 500 mg

Glucovance®: 5 mg/500 mg: Glyburide 5 mg and metformin hydrochloride 500 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Glucovance)

1.25-250 mg (60): $55.99

2.5-500 mg (60): $85.99

5-500 mg (60): $92.00

Tablets (Glyburide-Metformin)

1.25-250 mg (60): $39.99

2.5-500 mg (60): $45.99

5-500 mg (100): $83.99

Mechanism of ActionThe combination of glyburide and metformin is used to improve glycemic control in patients with type 2 diabetes mellitus by using two different, but complementary, mechanisms of action:

Glyburide: Stimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Metformin: Decreases hepatic glucose production, decreasing intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and utilization)

Pharmacodynamics/Kinetics

Glucovance®:

Bioavailability: 18% with 2.5 mg glyburide/500 mg metformin dose; 7% with 5 mg glyburide/500 mg metformin dose; bioavailability is greater than that of Micronase® brand of glyburide and therefore not bioequivalent

Time to peak: 2.75 hours when taken with food

Glyburide: See Glyburide monograph.

Metformin: This component of Glucovance® is bioequivalent to metformin coadministration with glyburide.

Related Information

- GlyBURIDE
- MetFORMIN

Dental Health: Effects on Dental TreatmentGlyburide-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia. Metformin-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common; may cause sedation
Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; phenothiazines and TCAs may antagonize glyburide's hypoglycemic effects; MAO inhibitors and TCAs may enhance hypoglycemic effects; concurrent use with psychotropics may produce additive sedation
Cardiovascular ConsiderationsCombination therapy for the treatment of diabetes should be individualized for each patient.

Glyburide: The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Metformin: Metformin, alone or in combination with other agents (sulfonylurea), is effective in the management of diabetes. Lactic acidosis is an uncommon side effect in patients without renal or respiratory insufficiency, hepatic failure, or conditions that predispose to hypoxemia. As heart failure may affect renal and pulmonary function, metformin should be avoided or used with caution in patients with diabetes and heart failure.

Index Terms Glyburide and Metformin Hydrochloride; Metformin and Glyburide

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Use: Unlabeled/InvestigationalAlternative to insulin in women for the treatment of gestational diabetes mellitus (GDM) (11-33 weeks gestation)

Dosing: Adults

Type 2 diabetes: Oral:

Note: Regular tablets cannot be used interchangeably with micronized tablet formulations

Regular tablets (Diaβeta®, Micronase®):

Initial: 2.5-5 mg/day, administered with breakfast or the first main meal of the day. In patients who are more sensitive to hypoglycemic drugs, start at 1.25 mg/day.

Adjustment: Increase in increments of no more than 2.5 mg/day at weekly intervals based on the patient's blood glucose response

Maintenance: 1.25-20 mg/day given as single or divided doses; maximum: 20 mg/day

Micronized tablets (Glynase® PresTab®):

Initial: 1.5-3 mg/day, administered with breakfast or the first main meal of the day in patients who are more sensitive to hypoglycemic drugs, start at 0.75 mg/day. Increase in increments of no more than 1.5 mg/day in weekly intervals based on the patient's blood glucose response.

Maintenance: 0.75-12 mg/day given as a single dose or in divided doses. Some patients (especially those receiving >6 mg/day) may have a more satisfactory response with twice-daily dosing. Maximum: 12 mg/day

Dosing: ElderlyRegular tablets (Diaβeta®, Micronase®): Oral: Initial: 1.25-2.5 mg/day, increase by 1.25-2.5 mg/day every 1-3 weeks. Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Not recommended

Dosing: Hepatic ImpairmentUse conservative initial and maintenance doses and avoid use in severe disease.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister with meals at the same time each day. Patients who are anorexic or NPO may need to have their dose held to avoid hypoglycemia.

Dietary ConsiderationsShould be taken with meals at the same time each day. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness).

ContraindicationsHypersensitivity to glyburide, any component of the formulation, or other sulfonamides; type 1 diabetes mellitus (insulin dependent, IDDM), diabetic ketoacidosis; concurrent use with bosentan

Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse reactions:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal, hepatic, adrenal and/or pituitary function; use with caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Elderly: Rapid and prolonged hypoglycemia (>12 hours) despite hypertonic glucose injections have been reported; age and hepatic and renal impairment are independent risk factors for hypoglycemia; dosage titration should be made at weekly intervals.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsRapid and prolonged hypoglycemia (>12 hours) despite hypertonic glucose injections has been reported; age, hepatic, and renal impairment are independent risk factors for hypoglycemia; dosage titration should be made at weekly intervals. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Use with caution in the elderly with renal insufficiency.

Pregnancy Risk FactorB/C (manufacturer dependent)

Pregnancy ConsiderationsReproduction studies differ by manufacturer labeling. Because adverse events were not observed in animal reproduction studies, one manufacturer classifies glyburide as pregnancy category B. Because adverse events were noted in animal studies during the period of lactation, another manufacturer classifies glyburide as pregnancy category C.

Glyburide was not found to significantly cross the placenta *in vitro* and was not found in the cord serum infants of mothers taking glyburide for gestational diabetes mellitus (GDM). Nonteratogenic effects such as hypoglycemia in the neonate have been associated with maternal glyburide use. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. The manufacturer recommends that if glyburide is used during pregnancy, it should be discontinued at least 2 weeks before the expected delivery date. Although studies have shown positive outcomes using glyburide for the treatment of GDM, use may not be appropriate for all women. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of type 2 diabetes mellitus during pregnancy. Insulin is considered the drug of choice for the control of diabetes mellitus during pregnancy.

LactationDoes not enter breast milk/use caution

Breast-Feeding ConsiderationsData from initial studies note that glyburide was not detected in breast milk. Breast-feeding is not recommended by the manufacturer. Potentially, hypoglycemia may occur in a nursing infant exposed to a sulfonylurea via breast milk.

Pregnancy & Lactation, In-Depth

- GlyBURIDE in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Vasculitis

Central nervous system: Dizziness, headache

Dermatologic: Erythema, maculopapular eruptions, morbilliform eruptions, pruritus, purpura, rash, urticaria, photosensitivity reaction

Endocrine & metabolic: Disulfiram-like reaction, hypoglycemia, hyponatremia (SIADH reported with other sulfonylureas)

Gastrointestinal: Anorexia, constipation, diarrhea, epigastric fullness, heartburn, nausea

Genitourinary: Nocturia

Hematologic: Leukopenia, thrombocytopenia, hemolytic anemia, agranulocytosis, aplastic anemia, pancytopenia, porphyria cutanea tarda

Hepatic: Cholestatic jaundice, hepatitis, transaminase increased

Neuromuscular & skeletal: Arthralgia, myalgia, paresthesia

Ocular: Blurred vision

Renal: Diuretic effect (minor)

Miscellaneous: Allergic reaction

Metabolism/Transport Effects**Inhibits** CYP2C8 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Bosentan: GlyBURIDE may enhance the hepatotoxic effect of Bosentan. GlyBURIDE may increase the metabolism of Bosentan. Bosentan may increase the metabolism of GlyBURIDE. *Risk X: Avoid combination*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Colesevelam: May decrease the serum concentration of GlyBURIDE. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol (may cause hypoglycemia).

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of glyburide. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle

Monitoring ParametersSigns and symptoms of hypoglycemia, fasting blood glucose, hemoglobin A_{1c}

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypoglycemia) at regular intervals during therapy. Teach patient proper use (or refer patient to diabetic educator) for instruction, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsFasting blood glucose, hemoglobin A_{1c}, fructosamine

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. Monitor glucose as recommended by prescriber. Other important components of treatment plan may include prescribed diet and exercise regimen (consult prescriber or diabetic educator). If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Take exactly as directed, 30 minutes before meal(s) at the same time each day. Do not change dose or discontinue without consulting prescriber. Avoid alcohol while taking this medication; could cause severe reaction. Do not take other medication within 2 hours of this medication unless advised by prescriber. You may experience more sensitivity to sunlight (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); headache; or nausea (consult prescriber if these persist). Report severe or persistent side effects; hypoglycemia (palpitations, sweaty palms, lightheadedness); extended vomiting, diarrhea, or constipation; flu-like symptoms; skin rash; easy bruising or bleeding; or change in color of urine or stool. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 1.25 mg, 2.5 mg, 5 mg

- Diaβeta®: 1.25 mg, 2.5 mg, 5 mg
- Micronase®: 1.25 mg, 2.5 mg [DSC], 5 mg

Tablet, micronized: 1.5 mg, 3 mg, 6 mg

- Glynase® PresTab®: 1.5 mg, 3 mg, 6 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Diabeta)

- 1.25 mg (50): $27.11
- 2.5 mg (30): $28.20
- 5 mg (30): $35.99

Tablets (GlyBURIDE)

- 1.25 mg (30): $12.99
- 2.5 mg (30): $12.99
- 5 mg (30): $11.99

Tablets (GlyBURIDE Micronized)

- 1.5 mg (90): $26.00
- 3 mg (90): $15.00
- 6 mg (90): $17.00

Tablets (Glynase)

- 1.5 mg (60): $50.07
- 3 mg (60): $73.64
- 6 mg (60): $114.89

Tablets (Micronase)

- 1.25 mg (30): $17.39
- 2.5 mg (30): $28.10
- 5 mg (30): $44.99

Mechanism of ActionStimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Pharmacodynamics/Kinetics

Onset of action: Serum insulin levels begin to increase 15-60 minutes after a single dose

Duration: ≤24 hours

Absorption: Significant within 1 hour

Distribution: 9-10 L

Protein binding, plasma: >99% primarily to albumin

Metabolism: Hepatic; forms metabolites (weakly active)

Half-life elimination: Diabeta®, Micronase®: 10 hours; Glynase® PresTab®: ~4 hours; may be prolonged with renal or hepatic impairment

Time to peak, serum: Adults: 2-4 hours

Excretion: Feces (50%) and urine (50%) as metabolites

Related Information

- Diabetes Mellitus Management, Adults
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentGlyburide-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; phenothiazines and TCAs may antagonize glimepiride hypoglycemic effects; MAO inhibitors and TCAs may enhance hypoglycemic effects

Cardiovascular ConsiderationsThe possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium-sensitive ATP channels, has been raised. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS and ADVANCE, do not reveal any increased cardiovascular mortality.

Index TermsDiabeta; Glibenclamide; Glybenclamide; Glybenzcyclamide

U.S. Brand NamesBausch & Lomb® Computer Eye Drops [OTC]; Colace® Adult/Children Suppositories [OTC]; Colace® Infant/Children Suppositories [OTC]; Fleet® Babylax® [OTC]; Fleet® Glycerin Suppositories Maximum Strength [OTC]; Fleet® Glycerin Suppositories [OTC]; Fleet® Liquid Glycerin Suppositories [OTC]; Osmoglyn® [DSC]; Sani-Supp® [OTC]

Pharmacologic CategoryLaxative, Osmotic; Ophthalmic Agent, Miscellaneous

Use: Labeled IndicationsConstipation; reduction of intraocular pressure; reduction of corneal edema; glycerin has been administered orally to reduce intracranial pressure

Dosing: Adults

Constipation: Rectal: 1 adult suppository 1-2 times/day as needed or 5-15 mL as an enema

Reduction of intracranial pressure: Oral: 1.5 g/kg/day divided every 4 hours; 1 g/kg/dose every 6 hours has also been used

Reduction of corneal edema: Ophthalmic solution: Instill 1-2 drops in eye(s) prior to examination OR for lubricant effect, instill 1-2 drops in eye(s) every 3-4 hours

Reduction of intraocular pressure: Oral: 1-1.8 g/kg 1-1$^{1}/_{2}$ hours preoperatively; additional doses may be administered at 5-hour intervals

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Constipation: Rectal:

Children <6 years: 1 infant suppository 1-2 times/day as needed or 2-5 mL as an enema

Children >6 years: Refer to adult dosing.

Reduction of intraocular pressure: Refer to adult dosing.

Reduction of intracranial pressure: Refer to adult dosing.

Reduction of corneal edema: Refer to adult dosing.

Storage

Refrigerate suppositories; avoid freezing. Protect from heat.

Ophthalmic: Store at room temperature. Keep bottle tightly closed. Discard 6 months after dropper is first placed in the solution.

Geriatric ConsiderationsThe primary use of glycerin in the elderly is as a laxative, although it is not recommended as a first-line treatment

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias

Central nervous system: Headache, confusion, dizziness, hyperosmolar nonketotic coma

Endocrine: Polydipsia, hyperglycemia, dehydration

Gastrointestinal: Nausea, vomiting, tenesmus, rectal irritation, cramping pain, diarrhea, dry mouth

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic, sterile (Bausch & Lomb® Computer Eye Drops): 1% (15 mL) [contains benzalkonium chloride]

Solution, oral (Osmoglyn®): 50% (220 mL) [lime flavor] [DSC]

Solution, rectal:

Fleet® Babylax®: 2.3 g/2.3 mL (4 mL) [6 units per box]

Fleet® Liquid Glycerin Suppositories: 5.6 g/5.5 mL (7.5 mL) [4 units per box]

Suppository, rectal: 82.5% (12s, 25s) [pediatric size]; 82.5% (12s, 24s, 25s, 50s, 100s) [adult size]

Colace® Adult/Children: 2.1 g (12s, 24s, 48s, 100s)

Colace® Infant/Children: 1.2 g (12s, 24s)

Fleet® Glycerin Suppositories: 1 g (12s) [pediatric size]; 2g (12s, 24s, 50s) [adult size]

Fleet® Glycerin Suppositories Maximum Strength: 3g (18s) [adult size]

Sani-Supp®: 82.5% (10s, 25s) [pediatric size]; 82.5% (10s, 25s, 50s) [adult size]

Generic Available Yes: Suppositories

Mechanism of Action Osmotic dehydrating agent which increases osmotic pressure; draws fluid into colon and thus stimulates evacuation

Pharmacodynamics/Kinetics

Onset of action:

- Decrease in intraocular pressure: Oral: 10-30 minutes
- Reduction of intracranial pressure: Oral: 10-60 minutes
- Constipation: Suppository: 15-30 minutes
- Peak effect:
  - Decrease in intraocular pressure: Oral: 60-90 minutes
  - Reduction of intracranial pressure: Oral: 60-90 minutes

Duration:

- Decrease in intraocular pressure: Oral: 4-8 hours
- Reduction of intracranial pressure: Oral: ~2-3 hours

Absorption: Oral: Well absorbed; Rectal: Poorly absorbed

Half-life elimination, serum: 30-45 minutes

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause confusion or dizziness

Mental Health: Effects on Psychiatric Treatment None reported

U.S. Brand NamesRobinul®; Robinul® Forte

Canadian Brand NamesGlycopyrrolate Injection, USP

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled IndicationsInhibit salivation and excessive secretions of the respiratory tract preoperatively; reversal of neuromuscular blockade; control of upper airway secretions; adjunct in treatment of peptic ulcer

Dosing: Adults

Reduction of secretions: I.M.:

Preoperative: I.M.: 4 mcg/kg 30-60 minutes before procedure

Intraoperative: I.V.: 0.1 mg repeated as needed at 2- to 3-minute intervals

Reversal of neuromuscular blockade: I.V.: 0.2 mg for each 1 mg of neostigmine or 5 mg of pyridostigmine administered or 5-15 mcg/kg glycopyrrolate with 25-70 mcg/kg of neostigmine or 0.1-0.3 mg/kg of pyridostigmine (agents usually administered simultaneously, but glycopyrrolate may be administered first if bradycardia is present)

Peptic ulcer:

Oral: 1-2 mg 2-3 times/day

I.M., I.V.: 0.1-0.2 mg 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Reduction of secretions:

Preoperative: I.M.:

<2 years: 4-9 mcg/kg 30-60 minutes before procedure

>2 years: 4 mcg/kg 30-60 minutes before procedure

Intraoperative: I.V.: 4 mcg/kg not to exceed 0.1 mg; repeat at 2- to 3-minute intervals as needed.

Chronic:

Oral: 40-100 mcg/kg/dose 3-4 times/day

I.M., I.V.: 4-10 mcg/kg/dose every 3-4 hours; maximum: 0.2 mg/dose or 0.8 mg/24 hours

Reversal of neuromuscular blockade: Refer to adult dosing.

Administration: I.V.Administer at a rate of 0.2 mg over 1-2 minutes.

Administration: I.V. DetailFor I.V. administration, glycopyrrolate may be administered by I.M. or I.V. without dilution. May also be administered via the tubing of a running I.V. infusion of a compatible solution. May be administered in the same syringe with neostigmine or pyridostigmine.

pH: 2-3

StorageStore at 20°C to 25°C (68°F to 77°F).

CompatibilityStable in $D_5{}^1/_2NS$, D_5W, $D_{10}W$, LR, NS.

Y-site administration: Compatible: Propofol.

Compatibility in syringe: Compatible: Atropine, butorphanol, chlorpromazine, cimetidine, codeine, diphenhydramine, droperidol, droperidol and fentanyl, hydromorphone, hydroxyzine, levorphanol, lidocaine, meperidine, meperidine and promethazine, midazolam, morphine, nalbuphine, neostigmine, ondansetron, oxymorphone, physostigmine, procaine, prochlorperazine edisylate, promazine, promethazine, propiomazine, pyridostigmine, ranitidine, scopolamine, triflupromazine, trimethobenzamide. **Incompatible:** Chloramphenicol, dexamethasone sodium phosphate, diazepam, dimenhydrinate, methohexital, pentazocine, pentobarbital, secobarbital, sodium bicarbonate, thiopental.

Compatibility when admixed: Compatible: Buprenorphine. **Incompatible:** Methylprednisolone sodium succinate.

ContraindicationsHypersensitivity to glycopyrrolate or any component of the formulation; severe ulcerative colitis, toxic megacolon complicating ulcerative colitis, paralytic ileus, obstructive disease of GI tract, intestinal atony in the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; narrow-angle glaucoma; acute hemorrhage; tachycardia; obstructive uropathy; myasthenia gravis

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.
- Pigment effects: Caution should be used in individuals demonstrating decreased pigmentation (skin and iris coloration, dark versus light) since there has been some evidence that these individuals have an enhanced sensitivity to the anticholinergic response.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Gastric ulcer treatment: Use of anticholinergics in gastric ulcer treatment may cause a delay in gastric emptying due to antral statis.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hiatal hernia: Use with caution in patients with hiatal hernia with reflux.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis; may precipitate/aggravate toxic megacolon.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for anticholinergic effects, confusion, and hallucinations.
- Pediatrics: Infants, patients with Down syndrome, and children with spastic paralysis or brain damage may be hypersensitive to antimuscarine effects. Not recommended for use in children <12 years of age for the management of peptic ulcer or <16 years for preanesthetic use.

Dosage form specific issues:

- Benzyl alcohol: Injection contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Geriatric ConsiderationsAnticholinergic agents are generally not well tolerated in the elderly and their use should be avoided when possible.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Small amounts of glycopyrrolate cross the human placenta.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsMay suppress lactation

Adverse ReactionsFrequency not defined. **Note:** Includes adverse effects which may occur as an extension of the pharmacologic action of anticholinergics (including glycopyrrolate) and adverse effects reported postmarketing with glycopyrrolate.

Cardiovascular: Arrhythmias, cardiac arrest, heart block, hyper-/hypotension, malignant hyperthermia, palpitation, QT_c interval prolongation, tachycardia

Central nervous system: Confusion, dizziness, drowsiness, excitement, headache, insomnia, nervousness, seizure

Dermatologic: Dry skin, pruritus, sensitivity to light increased

Endocrine & metabolic: Lactation suppression

Gastrointestinal: Bloated feeling, constipation, loss of taste, nausea, vomiting, xerostomia

Genitourinary: Impotence, urinary hesitancy, urinary retention

Local: Irritation at injection site

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, cycloplegia, mydriasis, ocular tension increased, photophobia, sensitivity to light increased

Respiratory: Respiratory depression

Miscellaneous: Anaphylactoid reactions, diaphoresis decreased, hypersensitivity reactions

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Monitoring ParametersHeart rate; anticholinergic effects; bowel sounds

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, anything that may add to anticholinergic effects). Assess therapeutic effectiveness and adverse response (eg, excessive dryness of eyes, nose, mouth, throat). Teach patient proper use (self-administered), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed before meals; do not increase dose and do not discontinue without consulting prescriber. Void before taking medication. You may experience dizziness or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); dry mouth (sucking on lozenges may help); photosensitivity (wear dark glasses in bright sunlight); decreased ability to sweat (use caution in hot weather or hot rooms or engaging in strenuous activity); or impotence (temporary). Report excessive and persistent anticholinergic effects (blurred vision, headache, flushing, tachycardia, nervousness, constipation, dizziness, insomnia, mental confusion or excitement, dry mouth, altered taste perception, dysphagia, palpitations, bradycardia, urinary hesitancy or retention, impotence, decreased sweating). **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution: 0.2 mg/mL (1 mL, 2 mL, 5 mL, 20 mL)

Robinul®: 0.2 mg/mL (1 mL, 2 mL, 5 mL; 20 mL [DSC]) [contains benzyl alcohol]

Tablet: 1 mg, 2 mg

Robinul®: 1 mg

Robinul® Forte: 2 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Glycopyrrolate)

1 mg (100): $104.99

2 mg (90): $134.02

Tablets (Robinul)

1 mg (90): $309.09

Tablets (Robinul-Forte)

2 mg (60): $300.72

Mechanism of ActionBlocks the action of acetylcholine at parasympathetic sites in smooth muscle, secretory glands, and the CNS

Pharmacodynamics/Kinetics

Onset of action: Oral: 50 minutes; I.M.: 15-30 minutes; I.V.: ~1 minute

Peak effect: Oral: ~1 hour; I.M.: 30-45 minutes

Duration: Vagal effect: 2-3 hours; Inhibition of salivation: Up to 7 hours; Anticholinergic: Oral: 8-12 hours

Absorption: Oral: Poor and erratic

Distribution: V_d: 0.2-0.62 L/kg

Metabolism: Hepatic (minimal)

Bioavailability: ~10%

Half-life elimination: Infants: 22-130 minutes; Children 19-99 minutes; Adults: ~30-75 minutes

Excretion: Urine (as unchanged drug, I.M.: 80%, I.V.: 85%); bile (as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause drowsiness, confusion, amnesia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with other psychotropics may produce additive sedation and dry mouth

Index TermsGlycopyrronium Bromide

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(gold SOW dee um thye oh MAL ate)

U.S. Brand NamesMyochrysine®

Canadian Brand NamesMyochrysine®

Pharmacologic CategoryGold Compound

Use: Labeled IndicationsTreatment of progressive rheumatoid arthritis

Dosing: AdultsRheumatoid arthritis: I.M.: 10 mg first week; 25 mg second week; then 25-50 mg/week until 1 g cumulative dose has been given; if improvement occurs without adverse reactions, administer 25-50 mg every 2-3 weeks for 2-20 weeks, then every 3-4 weeks indefinitely

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRheumatoid arthritis: I.M.: Initial: Test dose of 10 mg is recommended, followed by 1 mg/kg/week for 20 weeks; maintenance: 1 mg/kg/dose at 2- to 4-week intervals thereafter for as long as therapy is clinically beneficial and toxicity does not develop. Administration for 2-4 months is usually required before clinical improvement is observed.

Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer 50% of normal dose.

Cl_{cr} <50 mL/minute: Avoid use.

Dosing: Adjustment for ToxicityIf toxicity develops, gold sodium thiomalate should be discontinued immediately and symptomatic treatment may be given as required. Severe reactions are a contraindication to further gold therapy. If the reaction to gold therapy is not severe, therapy may be resumed, generally 2-3 weeks following resolution of the toxic reaction. A challenge dose of 5-10 mg of gold may be administered; if the "challenge dose" is tolerated, dosage may be cautiously increased by 5-10 mg in subsequent injections until usual dosage is achieved (25-50 mg).

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Deep I.M. injection into the upper outer quadrant of the gluteal region; addition of 0.1 mL of 1% lidocaine to each injection may reduce the discomfort associated with I.M. administration. Patient should remain in recumbent position for approximately 10 minutes following administration.

StorageShould not be used if solution is darker than pale yellow.

ContraindicationsHypersensitivity to gold compounds or any component of the formulation; systemic lupus erythematosus; history of blood dyscrasias; congestive heart failure, exfoliative dermatitis, colitis

Allergy Considerations

- Gold Salt Allergy

Warnings/Precautions

Boxed warnings:

- Gold toxicity: **[U.S. Boxed Warning]: May be associated with significant toxicity involving dermatologic, gastrointestinal, hematologic, pulmonary, renal, and hepatic systems (see below); patient eduction is required.**

Concerns related to adverse effects:

- Dermatologic reactions: Dermatitis and lesions of the mucous membranes are common and may be serious; pruritus may precede the early development of a skin reaction. Consider alternative therapy in patients with dermatitis (urticaria or eczema; relative contraindication); may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

- Gastrointestinal effects: Signs of toxicity include persistent diarrhea, stomatitis, and enterocolitis; avoid use in patients with prior inflammatory bowel disease.

- Hematologic effects: Signs of toxicity include hematologic depression (depressed hemoglobin, eosinophilia >5%, leukocytes, granulocytes, or platelets). Avoid use in patients with a history of blood dyscrasias (anemia, agranulocytosis), hemorrhagic diathesis, or drug induced granulocytopenia. Symptoms of gold toxicity may be difficult to detect in patients with prior abnormalities; consider alternative therapy. Therapy should be discontinued if platelet count falls to <100,000/mm^3, WBC <4000, granulocytes <1500/mm^3.

- Hepatic effects: May be associated with the development of cholestatic jaundice. Consider alternative therapy in patients with hepatic impairment (relative contraindication); may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

- Hypersensitivity reactions: Rare hypersensitivity reactions, including anaphylactic shock, syncope, bradycardia, thickening of the tongue, difficulty in swallowing and breathing, and angioedema have been reported in association with injections of sodium aurothiomalate; treatment should be discontinued if occur. In addition, a vasomotor (nitritoid) reaction characterized by acute flushing and tachycardia may occur within minutes of injection; this reaction should be differentiated from anaphylaxis and therapy may be continued, but a careful evaluation of risk vs. benefit should be undertaken and extreme caution should be exercised before resuming therapy, particularly in patient with cardiovascular disease.

- Pulmonary toxicity: May be associated with interstitial fibrosis; monitor closely.
- Renal effects: Renal toxicity ranges from mild proteinuria to nephrotic syndrome. Consider alternative therapy in patients with renal impairment; may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

Disease-related concerns:

- Cardiovascular disease: Use caution in patients with HF, hypertension, or cerebrovascular disease.
- Systemic lupus erythematosus (SLE): Consider alternative therapy is patients with SLE (relative contraindication); may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

Concurrent drug therapy issues:

- ACE inhibitors: Concurrent use with ACE inhibitors may increase the risk of nitritoid reactions.
- Corticosteroids: In general, corticosteroids may be discontinued after initiation of therapy (corticosteroid tapering may be required).
- NSAIDs: May be discontinued after initiation of therapy.

Other warnings/precautions:

- Administration: Must not be injected I.V.
- Monitoring: Frequent monitoring of patients for signs and symptoms of toxicity will prevent serious adverse reactions.

Geriatric ConsiderationsTolerance to gold decreases with advanced age; use cautiously only after traditional therapy and other disease-modifying antirheumatic drugs (DMARDs) have been attempted. Since elderly frequently have Cl_{cr} <50 mL/minute, it is advisable to measure or calculate creatinine clearance before use.

Pregnancy Risk FactorC

LactationEnters breast milk/not recommended

Adverse ReactionsFrequency not defined.

Dermatologic: Alopecia, angioedema, pruritus, rash, urticaria

Gastrointestinal: Stomatitis, gingivitis, glossitis, dysphagia, taste disturbance (metallic), nausea, GI hemorrhage, diarrhea, enterocolitis (ulcerative)

Hematologic: Agranulocytosis, aplastic anemia, eosinophilia, leukopenia, thrombocytopenia

Hepatic: Cholestasis, hepatitis, hepatotoxicity, jaundice

Neuromuscular & skeletal: Peripheral neuropathy

Ocular: Conjunctivitis

Respiratory: Gold bronchitis, interstitial pneumonitis

Renal: Hematuria, proteinuria

Miscellaneous: Anaphylactoid reaction, anaphylaxis, nitritoid reaction

Drug Interactions

ACE Inhibitors: May enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Monitoring ParametersPatients should have a CBC with differential, platelet count, hemoglobin determination and urinalysis for protein, white cells, red cells and casts; at baseline and prior to each injection. Skin and oral mucosa should be inspected for skin rash, bruising or oral ulceration/stomatitis. Specific questioning for symptoms such as pruritus, rash, stomatitis or metallic taste should be included. Dosing should be withheld in patients with significant gastrointestinal, renal, dermatologic, or hematologic effects (platelet count falls to <100,000/mm^3, WBC <4000, granulocytes <1500/mm^3

Reference RangeGold: Normal: 0-0.1 mcg/mL (SI: 0-0.0064 µmol/L); Therapeutic: 1-3 mcg/mL (SI: 0.06-0.18 µmol/L); Urine: <0.1 mcg/24 hour

Monitoring: Lab TestsPatients should have a CBC with differential, platelet count, hemoglobin determination and urinalysis for protein, white cells, red cells and casts; at baseline and prior to each infection. Dosing should be withheld in patients with significant gastrointestinal, renal, dermatologic, or hematologic effects (platelet count falls to <100,000/mm^3, WBC <4000, granulocytes <1500/mm^3

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Myochrysine®: 50 mg/mL (1 mL, 10 mL)

Generic AvailableNo

Mechanism of ActionUnknown, may decrease prostaglandin synthesis or may alter cellular mechanisms by inhibiting sulfhydryl systems

Pharmacodynamics/Kinetics

Onset of action: Delayed; may require up to 3 months

Half-life elimination: 5 days; may be prolonged with multiple doses

Time to peak, serum: 4-6 hours

Excretion: Urine (60% to 90%); feces (10% to 40%)

Pharmacotherapy PearlsApproximately 50% gold
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, gingivitis, and glossitis.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine
Index TermsSodium Aurothiomalate
International Brand NamesAllochrysine (BE); Auromyose (NL); Aurothio (KP); Miocrin (CO, SG); Myocrisin (AE, AU, BB, BH, BM, BS, BZ, CY, DK, EG, FI, GB, GY, HK, HN, IE, IL, IQ, IR, JM, JO, KW, LB, LY, NL, NO, OM, PR, QA, SA, SE, SR, SY, TH, TT, YE); Tauredon (AT, CH, CZ, HN, PT, RU)

Gonadorelin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Gonadorelin may be confused with gonadotropin, guanadrel

Factrel® may be confused with Sectral®

Gonadotropin may be confused with gonadorelin

Pronunciation(goe nad oh RELL in)
U.S. Brand NamesFactrel®
Canadian Brand NamesLutrepulse™
Pharmacologic CategoryDiagnostic Agent; Gonadotropin
Use: Labeled IndicationsEvaluation of functional capacity and response of gonadotrophic hormones; evaluate abnormal gonadotropin regulation as in precocious puberty and delayed puberty.

Orphan drug: Lutrepulse®: Induction of ovulation in females with hypothalamic amenorrhea

Dosing: Adults

Diagnostic test: I.V., SubQ (hydrochloride salt): 100 mcg administered in women during early phase of menstrual cycle (day 1-7)

Primary hypothalamic amenorrhea: I.V. (acetate): 5 mcg every 90 minutes via Lutrepulse® pump kit at treatment intervals of 21 days (pump will pulsate every 90 minutes for 7 days)

Dosing: PediatricDiagnostic test: Children >12 years: Refer to adult dosing.
Administration: I.V.

Factrel®: Give I.V. push over 30 seconds.

Lutrepulse®: A presterilized reservoir bag with the infusion catheter set supplied with the kit should be filled with the reconstituted solution and administered I.V. using the Lutrepulse® pump. Set the pump to deliver 25-50 mL of solution, based upon the dose, over a pulse period of 1 minute and at a pulse frequency of 90 minutes.

Administration: I.V. DetailFactrel®: Dilute in 3 mL of normal saline.
Storage

Factrel®: After reconstitution, store at room temperature and use within 1 day. Discard unused portion.

Lutrepulse®: Store at room temperature.

Reconstitution

Factrel®: Prepare immediately prior to use.

Lutrepulse®: Reconstitute with diluent immediately prior to use and transfer to plastic reservoir. The solution will supply 90-minute pulsatile doses for 7 consecutive days (Lutrepulse® pump).

ContraindicationsHypersensitivity to gonadorelin or any component of the formulation; women with any condition that could be exacerbated by pregnancy; patients who have ovarian cysts or causes of anovulation other than those of hypothalamic origin; any condition that may worsened by reproductive hormones
Allergy Considerations

- GH-RH Analog Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity/anaphylactic reactions: Hypersensitivity and anaphylactic reactions have occurred following multiple-dose administration.

Disease-related concerns:

- Pituitary prolactinemia: Use with caution in women in whom pregnancy could worsen pre-existing conditions (eg, pituitary prolactinemia).

Other warnings/precautions:

- Multiple pregnancy: Alert patients that multiple pregnancy is a possibility.

Pregnancy Risk FactorB
LactationExcretion in breast milk unknown
Adverse Reactions

1% to 10%: Local: Pain at injection site

<1%: Flushing, lightheadedness, headache, rash, nausea, abdominal discomfort

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersLH, FSH
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. When used for induction of ovulation, assess results of laboratory tests and therapeutic effectiveness. Assess knowledge/teach patient appropriate use (use of pulsating pump if applicable), interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsLH, FSH
Patient EducationIf receiving this drug via pulsating pump, check all procedures with prescriber, and use exactly as prescribed. Report any rash, pain, or inflammation at injection site, and any change in respiratory status. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride: 100 mcg [diluent contains benzyl alcohol]

Generic AvailableNo
Mechanism of ActionStimulates the release of luteinizing hormone (LH) from the anterior pituitary gland
Pharmacodynamics/Kinetics

Onset of action: Peak effect: Maximal LH release: ~20 minutes

Duration: 3-5 hours

Half-life elimination: 4 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentAntipsychotics may decrease the effects of gonadorelin
Index TermsGnRH; Gonadorelin Acetate; Gonadorelin Hydrochloride; Gonadotropin Releasing Hormone; LHRH; LRH; Luteinizing Hormone Releasing Hormone
References

Pescovitz OH, Comite F, Hench K, et al, “The NIH Experience With Precocious Puberty: Diagnostic Subgroups and Response to Short-Term Luteinizing Hormone-Releasing Hormone Analogue Therapy,” *J Pediatr*, 1986, 108(1):47-54.[PubMed 3080571]

English

Jump To Field (Select Field Name)

Pronunciation(GOE se rel in)

U.S. Brand NamesZoladex®

Canadian Brand NamesZoladex®; Zoladex® LA

Pharmacologic CategoryAntineoplastic Agent, Gonadotropin-Releasing Hormone Agonist; Gonadotropin Releasing Hormone Agonist

Use: Labeled IndicationsPalliative treatment of advanced breast cancer and carcinoma of the prostate; treatment of endometriosis, including pain relief and reduction of endometriotic lesions; endometrial thinning agent as part of treatment for dysfunctional uterine bleeding

Dosing: Adults

Prostate cancer: SubQ:

Monthly implant: 3.6 mg injected into upper abdomen every 28 days

3-month implant: 10.8 mg injected into the upper abdominal wall every 12 weeks

Breast cancer, endometriosis, endometrial thinning: SubQ: Monthly implant: 3.6 mg injected into upper abdomen every 28 days

Note: For breast cancer, treatment may continue indefinitely; for endometriosis, it is recommended that duration of treatment not exceed 6 months. Only 1-2 doses are recommended for endometrial thinning.

Dosing: ElderlyRefer to adult dosing.

Dosing: Combination Regimens

Prostate cancer:

Bicalutamide + LHRH-A

FZ

Administration: OtherSubcutaneous implant: Insert the hypodermic needle into the subcutaneous fat. Do not try to aspirate with the goserelin syringe. If the needle is in a large vessel, blood will immediately appear in the syringe chamber. Change the direction of the needle so it parallels the abdominal wall. Push the needle in until the barrel hub touches the patient's skin. Fully depress the plunger to discharge. Withdraw needle and bandage the site. Confirm discharge by ensuring tip of the plunger is visible within the tip of the needle.

StorageZoladex® should be stored at room temperature not to exceed 25°C (77°F). Protect from light. Should be dispensed in a lightproof bag.

ContraindicationsHypersensitivity to goserelin, LHRH, LHRH agonist analogues, or any component of the formulation; pregnancy (or potential to become pregnant); breast-feeding

Allergy Considerations

- GnRH Agonist Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Decreased bone density: Has been reported in women and may be irreversible; use caution if other risk factors are present; evaluate and institute preventative treatment if necessary.

- Hypercalcemia: Has been reported in prostate and breast cancer patients with bone metastases.

- Pituitary apoplexy: Rare cases of pituitary apoplexy (frequently secondary to pituitary adenoma) have been observed with leuprolide administration (onset from 1 hour to usually <2 weeks); may present as sudden headache, vomiting, visual or mental status changes, and infrequently cardiovascular collapse; immediate medical attention required.

- Spinal cord suppression: Has been reported when used for prostate cancer; closely observe patients for weakness and paresthesias in first few weeks of therapy.

- Tumor flare: Transient worsening of signs and symptoms (tumor flare) may develop during the first few weeks of treatment.

- Urinary tract obstruction: Has been reported when used for prostate cancer; closely observe patients for urinary tract obstruction in first few weeks of therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo dosage adjustments are needed in the elderly. Monitoring for bone density changes, serum lipid and serum calcium changes is recommended.
Pregnancy Risk FactorX (endometriosis, endometrial thinning); D (advanced breast cancer)
Pregnancy ConsiderationsGoserelin has been found to be teratogenic and increases pregnancy loss in animal studies. Women of childbearing potential should avoid pregnancy. Pregnancy must be ruled out prior to treatment. Use of nonhormonal contraception should be used during therapy and following discontinuation until the return of menses (or for at least 12 weeks).
LactationEnters breast milk/contraindicated
Adverse ReactionsPercentages reported in males with prostatic carcinoma and females with endometriosis using the 1-month implant:

>10%:

Central nervous system: Headache (female 75%, male 1% to 5%), emotional lability (female 60%), depression (female 54%, male 1% to 5%), pain (female 17%, male 8%), insomnia (female 11%, male 5%)

Endocrine & metabolic: Hot flashes (female 96%, male 62%), sexual dysfunction (21%), erections decreased (18%), libido decreased (female 61%), breast enlargement (female 18%)

Genitourinary: Lower urinary symptoms (male 13%), vaginitis (75%), dyspareunia (female 14%)

Miscellaneous: Diaphoresis (female 45%, male 6%); infection (female 13%)

1% to 10%:

Cardiovascular: CHF (male 5%), arrhythmia, cerebrovascular accident, hypertension, MI, peripheral vascular disorder, chest pain, palpitation, tachycardia, edema

Central nervous system: Lethargy (male 8%), dizziness (female 6%, male 5%), abnormal thinking, anxiety, chills, fever, malaise, migraine, somnolence

Dermatologic: Rash (female >1%, male 6%), alopecia, bruising, dry skin, skin discoloration

Endocrine & metabolic: Breast pain (female 7%), breast swelling/tenderness (male 1% to 5%), dysmenorrhea, gout, hyperglycemia

Gastrointestinal: Anorexia (female >1%, male 5%), nausea (male 5%), constipation, diarrhea, flatulence, dyspepsia, ulcer, vomiting, weight increased, xerostomia

Genitourinary: Renal insufficiency, urinary frequency, urinary obstruction, urinary tract infection, vaginal hemorrhage

Hematologic: Anemia, hemorrhage

Neuromuscular & skeletal: Arthralgia, bone mineral density decreased (female; ~4% decrease in 6 months), joint disorder, paresthesia

Ocular: Amblyopia, dry eyes

Respiratory: Upper respiratory tract infection (male 7%), COPD (male 5%), pharyngitis (female 5%), bronchitis, cough, epistaxis, rhinitis, sinusitis

Miscellaneous: Allergic reaction

Postmarketing and/or case reports: Pituitary apoplexy

Oncology: VesicantNo
Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

Antidiabetic Agents: Luteinizing Hormone-Releasing Hormone Analogs may diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Test InteractionsSerum alkaline phosphatase, serum acid phosphatase, serum testosterone, serum LH and FSH, serum estradiol
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic effectiveness and adverse response periodically during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Do not give to women of childbearing age unless female is capable of complying with contraceptive measures 1 month prior to therapy, during therapy, and at least 12 weeks following therapy. Instruct patient in appropriate contraceptive measures.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug must be implanted under the skin of your abdomen every 28 days; it is important to maintain appointment schedule. Males or females, you may experience systemic hot flashes (layered, cool clothes may help); headache (consult prescriber for approved analgesic); constipation (increased bulk and water in diet or stool softener may help); sexual dysfunction (decreased libido, males: decreased erection, females: vaginal dryness); or bone pain (consult prescriber for approved analgesic). Symptoms may worsen temporarily during first weeks of therapy. Report chest pain, palpitations, or respiratory difficulty; swelling of extremities; unusual persistent nausea, vomiting, or constipation; chest pain or respiratory difficulty; unresolved dizziness; or skin rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant; do not get pregnant 1 month before, during, or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not donate blood during or for 1 month following therapy. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Implant, subcutaneous:

Zoladex®:

3.6 mg [1-month implant packaged with 16-gauge hypodermic needle]

10.8 mg [3-month implant packaged with 14-gauge hypodermic needle]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Implant (Zoladex)

10.8 mg (1): $1339.48

Mechanism of ActionGoserelin is a synthetic analog of luteinizing-hormone-releasing hormone (LHRH). Following an initial increase in luteinizing hormone (LH) and follicle stimulating hormone (FSH), chronic administration of goserelin results in a sustained suppression of pituitary gonadotropins. Serum testosterone falls to levels comparable to surgical castration. The exact mechanism of this effect is unknown, but may be related to changes in the control of LH or down-regulation of LH receptors.
Pharmacodynamics/Kinetics**Note:** Data reported using the 1-month implant.

Absorption: SubQ: Rapid and can be detected in serum in 10 minutes

Distribution: V_d: Male: 44.1 L; Female: 20.3 L

Time to peak, serum: SubQ: Male: 12-15 days, Female: 8-22 days

Half-life elimination: SubQ: Male: ~4 hours, Female: ~2 hours; Renal impairment: Male: 12 hours

Excretion: Urine (90%)

Granisetron

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Granisetron may be confused with dolasetron, ondansetron, palonosetron

Pronunciation(gra NI se tron)

U.S. Brand NamesGranisol™; Kytril®; Sancuso®

Canadian Brand NamesKytril®

Pharmacologic CategoryAntiemetic; Selective 5-HT_3 Receptor Antagonist

Use: Labeled IndicationsProphylaxis of nausea and vomiting associated with emetogenic chemotherapy and radiation therapy, (including total body irradiation and fractionated abdominal radiation); prophylaxis and treatment of postoperative nausea and vomiting (PONV)

Transdermal patch: Prophylaxis of nausea and vomiting associated with moderate-to-high emetogenic chemotherapy regimens ≤5 days consecutive duration

Generally **not** recommended for treatment of existing chemotherapy-induced emesis (CIE) or for prophylaxis of nausea from agents with a low emetogenic potential.

Dosing: Adults

Prophylaxis of chemotherapy-related emesis:

Oral: 2 mg once daily up to 1 hour before chemotherapy or 1 mg twice daily; the first 1 mg dose should be given up to 1 hour before chemotherapy.

I.V.:

Within U.S.: 10 mcg/kg/dose (maximum: 1 mg/dose) given 30 minutes prior to chemotherapy; for some drugs (eg, carboplatin, cyclophosphamide) with a later onset of emetic action, 10 mcg/kg every 12 hours may be necessary.

Outside U.S.: 40 mcg/kg/dose (or 3 mg/dose); maximum: 9 mg/24 hours

Breakthrough: Granisetron has not been shown to be effective in terminating nausea or vomiting once it occurs and should not be used for this purpose.

Transdermal patch: Prophylaxis of chemotherapy-related emesis: Apply 1 patch at least 24 hours prior to chemotherapy; do not apply ≥48 hours before chemotherapy. Remove patch a minimum of 24 hours after chemotherapy completion. Maximum duration: Patch may be worn up to 7 days, depending on chemotherapy regimen duration.

Prophylaxis of radiation therapy-associated emesis: Oral: 2 mg once daily given 1 hour before radiation therapy.

Postoperative nausea and vomiting (PONV): I.V.:

Prevention: 1 mg given undiluted over 30 seconds; administer before induction of anesthesia or immediately before reversal of anesthesia

Treatment: 1 mg given undiluted over 30 seconds

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricProphylaxis associated with cancer chemotherapy: Children >2 years: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Dosing: Hepatic ImpairmentKinetic studies in patients with hepatic impairment showed that total clearance was approximately halved; however, standard doses were very well tolerated, and dose adjustments are not necessary.

Administration: I.V.Administer I.V. push over 30 seconds or as a 5-10 minute-infusion

Prevention of PONV: Administer before induction of anesthesia or immediately before reversal of anesthesia.

Treatment of PONV: Administer undiluted over 30 seconds.

Administration: I.V. DetailpH: 4.7-7.3

Administration: OralDoses should be given up to 1 hour prior to initiation of chemotherapy/radiation

Administration: TopicalTransdermal (Sancuso®): Apply patch to clean, dry, intact skin on upper outer arm. Do not use on red, irritated or damaged skin. Remove patch from pouch immediately before application. Do not cut patch.

Storage

I.V.: Store at 15°C to 30°C (59°F to 86°F). Protect from light. Do not freeze vials. Stable when mixed in NS or D_5W for 7 days under refrigeration and for 3 days at room temperature.

Oral: Store tablet or oral solution at 15°C to 30°C (59°F to 86°F). Protect from light.

Transdermal patch: Store at 20°C to 25°C (68°F to 77°F). Keep patch in original packaging until immediately prior to use.

CompatibilityStable in $D_5{}^{1}/{}_{2}NS$, D_5NS, D_5W, NS, bacteriostatic water.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl sulfate complex, ampicillin, ampicillin/sulbactam, amsacrine, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, cladribine, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, fenoldopam mesylate, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, gentamicin, haloperidol, heparin, hetastarch in lactated electrolytes, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin calcium, levoleucovorin, linezolid, lorazepam, magnesium sulfate, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, mitomycin, mitoxantrone, morphine, nalbuphine, netilmicin, ofloxacin, paclitaxel, pemetrexed, piperacillin, piperacillin/tazobactam, potassium chloride, prochlorperazine edisylate, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, topotecan, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Amphotericin B.

Compatibility in syringe: Compatible: Dexamethasone sodium phosphate, methylprednisolone sodium succinate.

Compatibility when admixed: Compatible: Dexamethasone sodium phosphate, methylprednisolone sodium succinate.

ContraindicationsHypersensitivity to granisetron or any component of the formulation

Allergy Considerations

- Serotonin 5-HT$_3$ Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Use with caution in patients allergic to other 5-HT$_3$ receptor antagonists; cross-reactivity has been reported.

- ECG effects: Selective 5-HT$_3$ antagonists, including granisetron, have been associated with a number of dose-dependent increases in ECG intervals (eg, PR, QRS duration, QT/QT$_c$, JT), usually occurring 1-2 hours after I.V. administration. In general, these changes are not clinically relevant, however, when used in conjunction with other agents that prolong these intervals, arrhythmia may occur. When used with agents that prolong the QT interval (eg, Class I and III antiarrhythmics), clinically relevant QT interval prolongation may occur resulting in torsade de pointes. A number of trials have shown that 5-HT$_3$ antagonists produce QT interval prolongation to variable degrees. Use with caution in patients at risk of QT prolongation and/or ventricular arrhythmia. Reduction in heart rate may also occur with the 5-HT$_3$ antagonists. I.V. formulations of 5-HT$_3$ antagonists have more association with ECG interval changes, compared to oral formulations.

Disease-related concerns:

- Long QT syndrome: Use with caution in patients with congenital long QT syndrome or other risk factors for QT prolongation (eg, medications known to prolong QT interval, electrolyte abnormalities [hypokalemia or hypomagnesemia], and cumulative high-dose anthracycline therapy).

Dosage form specific issues:

- Benzyl alcohol: Injection contains benzyl alcohol (1 mg/mL) which has been associated with "gasping syndrome" in neonates.

- Transdermal patch: Application site reactions, generally mild, have occurred with use; if skin reaction is severe or generalized, remove patch. Cover patch application site with clothing to protect from natural or artificial sunlight exposure while patch is applied and for 10 days following removal; granisetron may potentially be affected by natural or artificial sunlight. Do not apply to red, irritated or damaged skin.

Other warnings/precautions:

- Chemotherapy-related emesis: **For chemotherapy, should be used on a scheduled basis, not on an “as needed” (PRN) basis,** since data support the use of this drug only in the prevention of nausea and vomiting (due to antineoplastic therapy) and not in the rescue of nausea and vomiting. Should only be used in the first 24-48 hours of chemotherapy. Data does not support any increased efficacy in delayed nausea and vomiting.

- Ileus or gastric distention: Does not stimulate gastric or intestinal peristalsis; may mask progressive ileus and/or gastric distension.

- Postoperative nausea/vomiting use: Routine prophylaxis for PONV is not recommended in patients where there is little expectation of nausea and vomiting postoperatively. In patients where nausea and vomiting must be avoided postoperatively, administer to all patients even when expected incidence of nausea and vomiting is low.

Geriatric ConsiderationsClinical trials with patients older than 65 years of age are limited; however, the data indicates that safety and efficacy are similar to that observed in younger adults. No adjustment in dose necessary for elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsThere are no adequate or well-controlled studies in pregnant women. Teratogenic effects were not observed in animal studies. Injection (1 mg/mL strength) contains benzyl alcohol which may cross the placenta. Use only if benefit exceeds the risk.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (3% to 21%; transdermal patch: 1%)

Gastrointestinal: Constipation (3% to 18%)

Neuromuscular & skeletal: Weakness (5% to 18%)

1% to 10%:

Cardiovascular: QT_c prolongation (1% to 3%), hypertension (1% to 2%)

Central nervous system: Pain (10%), fever (3% to 9%), dizziness (4% to 5%), insomnia (<2% to 5%), somnolence (1% to 4%), anxiety (2%), agitation (<2%), CNS stimulation (<2%)

Dermatologic: Rash (1%)

Gastrointestinal: Diarrhea (3% to 9%), abdominal pain (4% to 6%), dyspepsia (3% to 6%), taste perversion (2%)

Hepatic: Liver enzymes increased (5% to 6%)

Renal: Oliguria (2%)

Respiratory: Cough (2%)

Miscellaneous: Infection (3%)

<1%, postmarketing, and/or case reports: Agitation, allergic reactions; anaphylaxis (including hypotension, dyspnea, urticaria); angina, application site reactions (transdermal patch), arrhythmias, atrial fibrillation, extrapyramidal syndrome, hot flashes, hypotension, hypersensitivity, syncope

Oncology: VesicantNo

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

Apomorphine: Antiemetics (5HT3 Antagonists) may enhance the hypotensive effect of Apomorphine. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringAssess allergy history (selective $5\text{-}HT_3$ receptor antagonists) prior to administering. Use with caution in presence of, or potential for, cardiac conduction abnormalities (eg, QT prolongation, medication known to prolong QT interval, electrolyte abnormalities). I.V.: Follow infusion specifics. **Note:** Oral and I.V. doses have different schedules and should not be administered on PRN basis. Assess therapeutic effectiveness and adverse reactions on a regular basis. Teach patient possible side effects and adverse symptoms to report.

Patient EducationThis drug is given to reduce the incidence of nausea and vomiting. Do not take any other medication for nausea and vomiting with this medication unless approved by prescriber. If this medication is given by intravenous infusion you will be monitored during infusion. Report immediately any chest pain, respiratory difficulty, pain or itching at infusion site. Self-administered oral doses must be taken exactly as directed. You may experience headache, drowsiness, or dizziness (request assistance when getting up or changing position and do not perform activities requiring alertness (including driving) until response to drug is known). Report chest pain or palpitations; persistent headache; excessive drowsiness; fever; or changes in elimination patterns (constipation or diarrhea) or other adverse effects. **Breast-feeding precaution:** Consult prescriber if you are or intend to breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution: 1 mg/mL (1 mL, 4 mL)

Kytril®: 1 mg/mL (1 mL, 4 mL) [contains benzyl alcohol]

Injection, solution [preservative free]: 0.1 mg/mL (1 mL); 1 mg/mL (1 mL)

Kytril®: 0.1 mg/mL (1 mL)

Solution, oral:

Granisol™: 2 mg/10 mL (30 mL) [contains sodium benzoate; orange flavor]

Kytril®: 2 mg/10 mL (30 mL) [contains sodium benzoate; orange flavor] [DSC]

Tablet: 1 mg

Kytril®: 1 mg

Sancuso®: 3.1 mg/24 hours (1s) [52 cm^2, total granisetron 34.3 mg]

Generic AvailableYes

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Granisetron HCl)

1 mg (2): $45.99

Tablets (Kytril)

1 mg (2): $131.99

Mechanism of ActionSelective 5-HT$_3$-receptor antagonist, blocking serotonin, both peripherally on vagal nerve terminals and centrally in the chemoreceptor trigger zone

Pharmacodynamics/Kinetics

Duration: Oral, I.V.: Generally up to 24 hours

Absorption: Oral: Tablets and oral solution are bioequivalent; Transdermal patch: ~66% over 7 days

Distribution: V$_d$: 2-4 L/kg; widely throughout body

Protein binding: 65%

Metabolism: Hepatic via N-demethylation, oxidation, and conjugation; some metabolites may have 5-HT$_3$ antagonist activity

Half-life elimination: Oral: 6 hours; I.V.: 9 hours

Time to peak, plasma: Transdermal patch: Maximum systemic concentrations: ~48 hours after application (range: 24-168 hours)

Excretion: Urine (12% as unchanged drug, 48% to 49% as metabolites); feces (34% to 38% as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

International issues: Fulvicin® (brand name used in international markets) may be confused with Furacin®

Pronunciation(gri see oh FUL vin)
U.S. Brand NamesGrifulvin® V; Gris-PEG®
Pharmacologic CategoryAntifungal Agent, Oral
Use: Labeled IndicationsTreatment of susceptible tinea infections of the skin, hair, and nails
Dosing: Adults

Tinea infections: Oral:

Microsize: 500-1000 mg/day in single or divided doses

Ultramicrosize: 375 mg/day in single or divided doses; doses up to 750 mg/day have been used for infections more difficult to eradicate such as tinea unguium and tinea pedis.

Note: Duration of therapy depends on the site of infection:

Tinea corporis: 2-4 weeks

Tinea capitis: 4-6 weeks or longer (up to 8-12 weeks)

Tinea pedis: 4-8 weeks

Tinea unguium: 4-6 months

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Tinea infections: Oral: Children >2 years:

Microsize: 10-20 mg/kg/day in single or divided doses. In the treatment of tinea capitis, higher dosages (20-25 mg/kg/day for 8-12 weeks) have been recommended by some authors (unlabeled).

Ultramicrosize: Usual: 7.3 mg/kg/day in single dose or 2 divided doses; range: 5-15 mg/kg/day in single dose or 2 divided doses (maximum: 750 mg/day)

Administration: OralAdminister with a fatty meal (peanuts or ice cream) to increase absorption, or with food or milk to avoid GI upset

Gris-PEG® tablets: May be swallowed whole or crushed and sprinkled onto 1 tablespoonful of applesauce and swallowed immediately without chewing.

ContraindicationsHypersensitivity to griseofulvin or any component of the formulation; severe liver disease; porphyria (interferes with porphyrin metabolism); pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Hypersensitivity cross reaction between penicillins and griseofulvin is possible.
- Photosensitivity: Avoid exposure to intense sunlight to prevent photosensitivity reactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤2 years of age.
- Pregnancy: May cause fetal harm when administered to pregnant women.

Other warnings/precautions:

- Monitoring: During long-term therapy, periodic assessment of hepatic, renal, and hematopoietic functions should be performed.

Geriatric ConsiderationsNo specific changes in dosing are needed.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have shown decreased spermatogenesis, as well as embryotoxic and teratogenic effects with

griseofulvin. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy is contraindicated.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, fatigue, headache, insomnia, mental confusion

Dermatologic: Angioneurotic edema (rare), erythema multiforme-like drug reaction, photosensitivity, rash (most common), urticaria (most common),

Gastrointestinal: Nausea, vomiting, epigastric distress, diarrhea, GI bleeding

Genitourinary: Menstrual irregularities (rare)

Hematologic: Granulocytopenia, leukopenia

Hepatic: Hepatotoxicity

Neuromuscular & skeletal: Paresthesia (rare)

Renal: Nephrosis, proteinuria

Miscellaneous: Drug-induced lupus-like syndrome (rare), oral thrush

Metabolism/Transport Effects**Induces** CYP1A2 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): Griseofulvin may enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Barbiturates: May decrease the absorption of Griseofulvin. **Exceptions:** Methohexital; Thiopental. *Risk D: Consider therapy modification*

Contraceptive (Progestins): Griseofulvin may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

CycloSPORINE: Griseofulvin may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Griseofulvin may increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Griseofulvin may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression). Concomitant use with ethanol will cause “disulfiram”-type reaction consisting of tachycardia, flushing, headache, nausea, and in some patients, vomiting and chest and/or abdominal pain.

Food: Griseofulvin concentrations may be increased if taken with food, especially with high-fat meals.

Test InteractionsFalse-positive urinary VMA levels

Monitoring ParametersPeriodic renal, hepatic, and hematopoietic function tests

Nursing: Physical Assessment/MonitoringAssess allergic history prior to beginning treatment (cross reaction with penicillin is possible). Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, decreased effectiveness of oral contraceptives). Assess results of laboratory tests, renal function, and hepatic function with long-term use, therapeutic effectiveness (resolution of viral infection), and adverse response (eg, CNS changes, gastrointestinal upset, rash, opportunistic infection) periodically during therapy. Teach patient proper use, possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPeriodic renal, hepatic, and hematopoietic function especially with long-term use

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, around-the-clock with food. Take full course of medication; do not discontinue without consulting prescriber. Avoid alcohol while taking this drug (disulfiram reactions). Practice good hygiene measures to prevent reinfection. Frequent blood tests may be required with prolonged therapy. You may experience confusion, dizziness, drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or diarrhea (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or increased sensitivity to sun (use sunscreen, wear protective clothing and eyewear, and avoid excessive exposure to direct sunlight). Report skin rash; respiratory difficulty; CNS changes (confusion, dizziness, acute headache); changes in color of stool or urine; white plaques in mouth; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral [microsize]: 125 mg/5mL (120 mL)

Grifulvin® V: 125 mg/5 mL (120 mL) [contains alcohol 0.2%]

Tablet, oral [microsize]:

Grifulvin® V: 500 mg

Tablet, oral [ultramicrosize]:

Gris-PEG®: 125 mg, 250 mg

Generic AvailableYes: Suspension, ultramicrosized product

Pricing: U.S. (www.drugstore.com)

Suspension (Grifulvin V)

125 mg/5 mL (120): $68.14

Suspension (Griseofulvin Microsize)

125 mg/5 mL (120): $43.00

Tablets (Gris-PEG)

125 mg (90): $162.41

Mechanism of ActionInhibits fungal cell mitosis at metaphase; binds to human keratin making it resistant to fungal invasion

Pharmacodynamics/Kinetics

Absorption: Ultramicrosize griseofulvin absorption is almost complete; absorption of microsize griseofulvin is variable (25% to 70% of an oral dose); enhanced by ingestion of a fatty meal (GI absorption of ultramicrosize is ~1.5 times that of microsize)

Distribution: Crosses placenta

Metabolism: Extensively hepatic

Half-life elimination: 9-22 hours

Excretion: Urine (<1% as unchanged drug); feces; perspiration

U.S. Brand NamesBrontex®; Cheracol®; Diabetic Tussin C®; Gani-Tuss® NR; Guaifenesin AC; Guaituss AC; Kolephrin® #1; Mytussin® AC; Robafen® AC; Romilar® AC; Tussi-Organidin® NR; Tussi-Organidin® S-NR; Tusso-C™

Pharmacologic CategoryAntitussive; Cough Preparation; Expectorant

Use: Labeled IndicationsTemporary control of cough due to minor throat and bronchial irritation

Dosing: Adults**Cough (antitussive/expectorant):** Oral:

Brontex® tablets: 1 tablet every 4 hours; maximum 6 tablets/24 hours

Diabetic Tussin C®, Kolephrin® #1, Romilar® AC, Tussi-Organidin® NR liquid: 10 mL every 4 hours; maximum 60 mL/24 hours

Note: Also refer to specific product labeling.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cough (antitussive/expectorant):** Oral:

Children:

2-6 years (Diabetic Tussin C® liquid, Tussi-Organidin® NR): Codeine 1 mg/kg/day in 4 divided doses

6-12 years (Diabetic Tussin C®, Kolephrin® #1, Romilar® AC, Tussi-Organidin® NR liquid): 5 mL every 4 hours; maximum 30 mL/24 hours

≥12 years: Refer to adult dosing.

Note: Also refer to specific product labeling.

Dietary ConsiderationsRomilar® AC contains phenylalanine. Diabetic Tussin C® contains phenylalanine 0.03 mcg/5 mL. Kolephrin® #1 contains sodium 1.1 mg/5 mL. Tusso-C™ contains phenylalanine 0.03 mcg/5 mL

RestrictionsC-V

ContraindicationsHypersensitivity to guaifenesin, codeine, or any component of the formulation; asthma

Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Fever: Use with caution in patients with fever.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory

depression occurs.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy of this combination have not been established in children <2 years of age.
- Surgery: Use with caution in patients with recent GI or urinary tract surgery.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing. Dose should not be increased if cough does not respond; reevaluate within 5 days for possible underlying pathology.

Geriatric ConsiderationsElderly may be more sensitive to the CNS depressant effects of codeine; monitor closely for excessive sedation.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Also see individual agents.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsCodeine is excreted in breast milk. Excretion of guaifenesin is not known. Also refer to Codeine monograph.
Adverse ReactionsFrequency not defined; also see individual agents.

Cardiovascular: Bradycardia, circulatory depression, flushing, orthostatic hypotension, palpitation, syncope, tachycardia

Central nervous system: Convulsions, CNS depression, disorientation, dizziness, dysphoria, euphoria, faintness, hallucinations (transient), headache, lightheadedness, sedation

Dermatologic: Angioneurotic edema, pruritus, urticaria

Gastrointestinal: Biliary tract spasm, colonic motility increase (with chronic ulcerative colitis), constipation, nausea, stomach pain, toxic dilation (with acute ulcerative colitis), vomiting

Genitourinary: Oliguria, urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Visual disturbances

Respiratory: Laryngeal edema, respiratory depression

Miscellaneous: Anaphylaxis, diaphoresis

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid: Guaifenesin 300 mg and codeine phosphate 10 mg per 5 mL (120 mL, 480 mL)

Brontex®: Guaifenesin 75 mg and codeine phosphate 2.5 mg per 5 mL (480 mL) [alcohol free; strawberry mint flavor]

Diabetic Tussin C®: Guaifenesin 200 mg and codeine phosphate 10 mg per 5 mL (480 mL) [contains phenylalanine 0.03 mcg/5 mL; cherry vanilla flavor]

Gani-Tuss® NR: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (480 mL) [raspberry flavor]

Guaifenesin AC: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (120 mL, 480 mL) [alcohol free, sugar free; raspberry flavor]

Kolephrin® #1: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (120 mL) [contains sodium 1.1 mg/5 mL and sodium benzoate]

Tussi-Organidin® NR: Guaifenesin 300 mg and codeine phosphate 10 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate; raspberry flavor]

Tussi-Organidin® S-NR: Guaifenesin 300 mg and codeine phosphate 10 mg per 5 mL (120 mL) [alcohol free, sugar free; contains sodium benzoate; raspberry flavor]

Syrup:

Cheracol®: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (120 mL) [contains alcohol 4.75% and benzoic acid]

Guaituss AC: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (120 mL, 480 mL) [contains alcohol; sugar free; fruit-mint flavor]

Mytussin® AC: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (120 mL, 480 mL) [contains alcohol; sugar free; fruit flavor]

Robafen® AC: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (120 mL, 480 mL)

Romilar® AC: Guaifenesin 100 mg and codeine phosphate 10 mg per 5 mL (480 mL) [alcohol free, sugar free, dye free; contains benzoic acid and phenylalanine; grape flavor]

Tusso-C™: Guaifenesin 200 mg and codeine phosphate 10 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; contains phenylalanine 0.03 mcg/5 mL; cherry vanilla flavor]

Tablet: Guaifenesin 300 mg and codeine phosphate 10 mg

Brontex®: Guaifenesin 300 mg and codeine phosphate 10 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Liquid (Brontex)

10-300 mg/20 mL (120): $32.99

Liquid (Tussi-Organidin NR)

300-10 mg/5 mL (473): $184.38

Syrup (Cheratussin AC)

100-10 mg/5 mL (118): $11.99

100-10 mg/5 mL (480): $15.98

Tablets (Brontex)

10-300 mg (30): $97.99

Tablets (Guaifenesin-Codeine)

300-10 mg (30): $13.99

Mechanism of Action

Guaifenesin may act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity

Codeine is an antitussive that controls cough by depressing the medullary cough center

Pharmacodynamics/KineticsSee individual agents.

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

Canadian Brand NamesBalminil DM E; Benylin® DM-E; Koffex DM-Expectorant; Robitussin® DM

Pharmacologic CategoryAntitussive; Cough Preparation; Expectorant

Use: Labeled IndicationsTemporary control of cough due to minor throat and bronchial irritation

Dosing: Adults**Cough (antitussive/expectorant):** Oral:

General dosing guidelines: Guaifenesin 200-400 mg and dextromethorphan 10-20 mg every 4 hours (maximum dose: Guaifenesin 2400 mg and dextromethorphan 120 mg per day)

Product-specific labeling:

Guaifenex® DM, Mucinex® DM, Touro® DM: 1-2 tablets every 12 hours (maximum: 4 tablets/24 hours)

Robitussin® DM, Robitussin® Sugar Free Cough: 10 mL every 4 hours (maximum: 6 doses/24 hours)

Vicks® 44E: 15 mL every 4 hours (maximum: 6 doses/24 hours)

Vicks® Pediatric Formula 44E: 30 mL every 4 hours (maximum: 6 doses/24 hours)

Z-Cof LA™: 1 tablet every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cough (antitussive/expectorant):** Oral: Children:

2-6 years:

General dosing guidelines: Guaifenesin 50-100 mg and dextromethorphan 2.5-5 mg every 4 hours (maximum dose: Guaifenesin 600 mg and dextromethorphan 30 mg per day)

Product-specific labeling:

Guaifenex® DM, Touro® DM: $^{1}/_{2}$ tablet every 12 hours (maximum: 1 tablet/24 hour)

Robitussin® DM, Robitussin® Sugar Free Cough: 2.5 mL every 4 hours (maximum: 6 doses/24 hours)

Vicks® Pediatric Formula 44E: 7.5 mL every 4 hours (maximum: 6 doses/24 hours)

6-12 years:

General dosing guidelines: Guaifenesin 100-200 mg and dextromethorphan 5-10 mg every 4 hours (maximum dose: Guaifenesin 1200 mg and dextromethorphan 60 mg per day)

Product-specific labeling:

Guaifenex® DM, Touro® DM: 1 tablet every 12 hours (maximum: 2 tablets/24 hours)

Robitussin® DM, Robitussin® Sugar Free Cough: 5 mL every 4 hours (maximum: 6 doses/24 hours)

Vicks® 44E: 7.5 mL every 4 hours (maximum: 6 doses/24 hours)

Vicks® Pediatric Formula 44E: 15 mL every 4 hours (maximum: 6 doses/24 hours)

Z-Cof LA™: $^{1}/_{2}$ tablet very 12 hours

≥12 years: Refer to adult dosing.

Administration: OralTake with water. Do not crush or chew extended release or long acting formulations.

Dietary ConsiderationsSafe Tussin® DM contains phenylalanine 4.2 mg/5 mL. Diabetic Tussin® DM and Diabetic Tussin® DM Maximum Strength contain phenylalanine 8.4 mg/5 mL. Vicks® 44E contains sodium 31 mg/15 mL; Vicks® Pediatric Formula 44E contains sodium 30 mg/15 mL. Mucinex® Children's Cough contains sodium 3 mg/5 mL

StorageStore at room temperature.

ContraindicationsHypersensitivity to guaifenesin, dextromethorphan, or any component of the formulation; use with or within 14 days of MAO inhibitor therapy

Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Special populations:

- Debilitated patients: Use with caution in patients who are sedated, debilitated or confined to a supine position.

- Pediatrics: Use with caution in atopic children. Not for OTC use in children <2 years of age.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

- Self-medication (OTC use): When used for self medication (OTC), notify healthcare provider if symptoms do not improve within 7 days, or are accompanied by fever, rash, or persistent headache.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to individual agents.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsDextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)
Drug Interactions

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.

Mechanism of Action

Guaifenesin is thought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity

Dextromethorphan is a chemical relative of morphine lacking narcotic properties except in overdose; controls cough by depressing the medullary cough center

Pharmacodynamics/KineticsSee individual agents.

Sina-12X suspension: 5-10 mL every 12 hours

Sina-12X tablet: 1-2 tablets every 12 hours; maximum: 4 tablets/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricExpectorant/decongestant: Oral:

Children 3-6 months (Donatussin): 0.3-0.6 mL; may repeat every 4-6 hours as needed; maximum 4 doses/24 hours

Children 6 months to 1 year (Donatussin): 0.6-1 mL; may repeat every 4-6 hours as needed; maximum: 4 doses/24 hours

Children 1-2 years (Donatussin): 1-2 mL; may repeat every 4-6 hours as needed; maximum: 4 doses/24 hours

Children 2-6 years:

Rescon GG, Sil-Tex: 2.5 mL every 4-6 hours; maximum 10 mL/24 hours

Sina-12X suspension: 2.5-5 mL every 12 hours

Children 6-12 years:

Aldex™, Crantex LA, Duomax, ExeTuss, Gentex LA, Liquibid-D®, PhenaVent™ D, Sina-12X tablet: One-half tablet every 12 hours; maximum: 1 tablet/24 hours

Deconsal® II: One capsule daily

Rescon GG: 5 mL every 4-6 hours; maximum: 20 mL/24 hours

ExeFen PD, Prolex®-D, Prolex®-PD: One-half to 1 tablet every 12 hours

Guaifed-PD®, PhenaVent™ Ped: One capsule every 12 hours

SINUvent® PE: One tablet every 12 hours; maximum: 2 tablets/24 hours

Sina-12X suspension: Refer to adult dosing.

Children ≥12 years:

Aldex™, Crantex LA, Deconsal® II, Duomax, ExeFen PD, ExeTuss, ExeTuss-GP, Gentex LA, Guaifed®, Guaifed-PD®, Liquibid-D®, PhenaVent™, PhenaVent™ D, PhenaVent™ LA, PhenaVent™ Ped, Prolex®-D, Prolex®-PD, Rescon GG, Sil-Tex, Sina-12X, SINUvent® PE: Refer to adult dosing

Administration: OralTablets and capsules should not be crushed or chewed. Capsules should not be opened.

Dietary ConsiderationsMay be taken with or without food. Taking with food, water or milk may help decrease gastric irritation.

ContraindicationsHypersensitivity to guaifenesin, phenylephrine, sympathomimetic amines, or any component of the formulation; severe hypertension; severe cardiovascular disease; use with or within 2 weeks of discontinuing MAO inhibitor

Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

Dosage form specific issues:

- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination. See individual agents.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsPhenylephrine is excreted in breast milk; excretion of guaifenesin is unknown. See individual agents.

Adverse ReactionsSee individual agents.

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Mechanism of ActionSee individual agents.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Guaifenesin: No significant effects or complications reported

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia (normal salivary flow resumes upon discontinuation); use vasoconstrictor with caution

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusGuaifenesin may cause drowsiness; phenylephrine may cause anxiety or restlessness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation or lessen the effects of anxiolytics depending on whether the effects of guaifenesin or phenylephrine predominate; concurrent use with MAO inhibitors may result in hypertensive crisis; avoid combination

Index TermsGuaifenesin and Phenylephrine Tannate; Phenylephrine Hydrochloride and Guaifenesin

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Maxifed-G®: One-half to 1 tablet every 12 hours (maximum: 2 tablets/24 hours)

>12 years: Refer to adult dosing.

Administration: OralOral: Do not open variable release capsules. Long acting formulations should not be crushed or chewed. May interfere with sleep; administering some products a few hours before bedtime may help minimize insomnia. Take with full glass of water.
ContraindicationsHypersensitivity to guaifenesin, pseudoephedrine, sympathomimetic amines, or any component of the formulation; use with or within 14 days of MAO inhibitor; severe hypertension or cardiovascular disease
Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.
- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever, rash, or persistent headache. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination. Refer to individual monographs.
LactationEnters breast milk/contraindicated (by some manufacturers)
Breast-Feeding ConsiderationsExcretion of guaifenesin into breast milk is unknown. Pseudoephedrine is excreted in breast milk. The use of this combination while breast-feeding is contraindicated by some manufacturers. Also refer to individual monographs.
Adverse ReactionsSee individual agents.
Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.

Pharmacologic Category[Antitussive](); [Decongestant]()

Use: Labeled IndicationsSymptomatic relief of dry nonproductive coughs and upper respiratory symptoms associated with hay fever, colds, or the flu

Dosing: Adults

Also refer to specific product labeling.

Oral:

Certuss-D®, Duraphen™ DM, Duraphen™ Forte, Maxiphen DM: One tablet every 12 hours, not to exceed 2 tablets/24 hours

Duraphen™ II DM: 1-$1^{1}/_{2}$ tablets twice daily, not to exceed 3 tablets/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Also refer to specific product labeling.

Children 6-12 years: Oral: Certuss-D®, Duraphen™ DM, Duraphen™ Forte, Duraphen™ II DM, Maxiphen DM: One-half tablet every 12 hours, not to exceed 1 tablet/24 hours

Children ≥12 years: Refer to adult dosing.

Administration: OralLong-acting tablet formulations may be broken in half, but should not be crushed or chewed. Administer with a full glass of water.

Dietary ConsiderationsGiltuss® Liquid contains phenylalanine 3.75 mg/5 mL

StorageRefer to individual product labeling.

Certuss-D, Duraphen™ DM, Duraphen™ Forte, Duraphen™ II DM, Maxiphen DM: Store at room temperature.

ContraindicationsHypersensitivity to guaifenesin, dextromethorphan, phenylephrine, sympathetic amines, or any component of the formulation; severe hypertension; coronary disease; prostatic hypertrophy; breast-feeding; use with or within 14 days of MAO inhibitors

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Debilitated patients: Use with caution in debilitated, sedated and/or patients confined to the supine position.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Use with caution in atopic children.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing. Re-evaluate if cough persists >7 days.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.

LactationEnters breast milk/ not recommended

Breast-Feeding ConsiderationsPhenylephrine is excreted in breast milk. See individual agents. Use of some products is contraindicated by manufacturers.

Adverse Reactions Reactions which follow have been reported with the combination product; see individual drug monographs for additional adverse reactions that may be expected from each agent.

Cardiovascular: Cardiovascular collapse, palpitation, tachycardia

Central nervous system: Anxiety, CNS depression, convulsions, dizziness, drowsiness, excitability increased, fear, hallucinations, headache, insomnia, irritability increased, lightheadedness, nervousness

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Tremor, weakness

Respiratory: Respiratory difficulties

Metabolism/Transport EffectsDextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Test InteractionsGuaifenesin: Possible color interference with determination of 5-HIAA and VMA; discontinue for 48 hours prior to test

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(gwye FEN e sin, soo doe e FED rin, & KOE deen)

U.S. Brand NamesGuiatuss DAC; Mytussin® DAC; Nucofed® Expectorant [DSC]; Nucofed® Pediatric Expectorant [DSC]

Canadian Brand NamesBenylin® 3.3 mg-D-E; Calmylin with Codeine

Pharmacologic CategoryAntitussive/Decongestant/Expectorant

Use: Labeled IndicationsTemporarily relieves nasal congestion and controls cough associated with upper respiratory infections and related conditions (common cold, sinusitis, bronchitis, influenza)

Dosing: Adults **Expectorant/decongestant/cough suppressant:** Oral:

Guaituss DAC: 10 mL every 4 hours (maximum 40 mL/24 hours)

Nucofed® Pediatric: 10 mL every 6 hours (maximum 40 mL/24 hours)

Nucofed®: 5 mL every 6 hours (maximum 20 mL/24 hours)

Dosing: Elderly Refer to adult dosing; use with caution.

Dosing: Pediatric **Expectorant/decongestant/cough suppressant:** Oral:

Children 2-6 years:

Nucofed® Pediatric: 2.5 mL every 6 hours (maximum 10 mL/24 hours)

Nucofed®: 1.25 mL every 6 hours (maximum 5 mL/24 hours)

Children 6-12 years:

Guaituss DAC: 5 mL every 4 hours (maximum 20 mL/24 hours)

Nucofed® Pediatric: 5 mL every 6 hours (maximum 20 mL/24 hours)

Nucofed®: 2.5 mL every 6 hours (maximum 10 mL/24hours)

Children >12 years: Refer to adult dosing.

Restrictions C-III; C-V

Contraindications Hypersensitivity to guaifenesin, pseudoephedrine, codeine, or any component of the formulation; use with or within 14 days of MAO inhibitor therapy

Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).

- Diabetes: Use with caution in patients with diabetes mellitus.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

- Ulcerative colitis: Use with caution in patients with chronic ulcerative colitis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Safety and efficacy of this combination have not been established in children <2 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing. Use caution with persistent cough or chronic cough (as with smoking, asthma, chronic bronchitis, emphysema) or cough accompanied by excessive phlegm. Re-evaluate if cough persists >7 days.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsPseudoephedrine and codeine are excreted in breast milk. Excretion of guaifenesin is not known. Also see individual agents.
Adverse ReactionsSee individual agents.
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pharmacologic CategoryAntitussive/Decongestant/Expectorant

Use: Labeled IndicationsTemporarily relieves nasal congestion and controls cough due to minor throat and bronchial irritation; helps loosen phlegm and thin bronchial secretions to make coughs more productive

Dosing: AdultsExpectorant/decongestant/cough suppressant: Oral:

Ambifed-G DM, Aquatab® C, Profen Forte™ DM: 1 tablet every 12 hours not to exceed 2 tablets/24 hours

Maxifed DM, Touro® CC, Pseudovent™ DM: 1-2 tablets every 12 hours, not to exceed 4 tablets/24 hours

Tri-Vent™ DM: Up to 10 mL 3-4 times/day, not to exceed pseudoephedrine 240 mg/24 hours

Profen II DM (tablet): 1 to $1^{1}/_{2}$ tablets every 12 hours, not to exceed 3 tablets/24 hours

Profen II DM (syrup): 5-10 mL every 4 hours, not to exceed 60 mL/24 hours

Z-Cof™ DM: 10 mL 2-3 times/day, not to exceed 30 mL/24 hours

Note: Also refer to specific product labeling.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricExpectorant/decongestant/cough suppressant: Oral:

Children 2-6 years:

Maxifed DM: $^{1}/_{3}$ to $^{1}/_{2}$ tablet every 12 hours, not to exceed 1 tablet/24 hours

Tri-Vent™ DM: 2.5 mL up to 3-4 times/day, not to exceed pseudoephedrine 4 mg/kg/day

Profen II DM (syrup): 1.25-2.5 mL every 4 hours, not to exceed 15 mL/24 hours

Touro® CC: $^{1}/_{2}$ tablet every 12 hour, not to exceed 1 tablet/24 hours

Z-Cof™ DM: 2.5 mL 2-3 times/day, not to exceed 7.5 mL/24 hours

Children 6-12 years:

Ambifed-G DM, Profen Forte™ DM, Profen II DM®: $^{1}/_{2}$ tablet every 12 hours not to exceed 1 tablet/24 hours

Maxifed DM: $^{1}/_{2}$ to 1 tablet every 12 hours, not to exceed 2 tablets/24 hours

Tri-Vent™ DM: 5 mL up to 3-4 times/day, not to exceed pseudoephedrine 4 mg/kg/day

Touro® CC, Pseudovent™ DM: 1 tablet every 12 hours, not to exceed 2 tablets/24 hours

Profen II DM (syrup): 2.5-5 mL every 4 hours, not to exceed 30 mL/24 hours

Z-Cof™ DM: 5 mL 2-3 times/day, not to exceed 15 mL/24 hours

Children ≥12 years: Refer to adult dosing.

Note: Also refer to specific product labeling.

Administration: OralLong-acting formulations should not be crushed or chewed. Take with a full glass of water.

ContraindicationsHypersensitivity to guaifenesin, pseudoephedrine, sympathomimetic amines, dextromethorphan, or any component of the formulation; use with or within 14 days of MAO inhibitors; severe hypertension or cardiovascular disease

Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Debilitated patients: Use with caution in debilitated, sedated and/or patients confined to the supine position.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Use with caution in atopic children. Not for OTC use in children <2 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination. Also see individual agents monographs. The use of this product during pregnancy is contraindicated by some manufacturers.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsSee individual agents. The use of this combination while breast-feeding is contraindicated by some manufacturers.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsDextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Self-medication (OTC use): When used for self medication (OTC) notify healthcare provider if symptoms do not improve within 7 days, or are accompanied by fever, rash or persistent headache. Do not use for persistent or chronic cough (as with smoking, asthma, chronic bronchitis, emphysema) or if cough is accompanied b excessive phlegm unless directed to do so by healthcare provider. Not for OTC use in children <2 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, drowsiness, headache

Dermatologic: Rash

Endocrine & metabolic: Uric acid levels decreased

Gastrointestinal: Nausea, vomiting, stomach pain

Postmarketing and/or case reports: Kidney stone formation (with consumption of large quantities)

Drug InteractionsThere are no known significant interactions.

Test InteractionsPossible color interference with determination of 5-HIAA and VMA; discontinue for 48 hours prior to test

Nursing: Physical Assessment/MonitoringAssess effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take as prescribed; do not exceed prescribed dose or frequency. Do not chew or crush extended release tablet; take with a full glass of water. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience some drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report excessive drowsiness, respiratory difficulty, lack of improvement, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Fenesin IR, Refenesen™ 400: 400 mg

Granules, oral:

Mucinex® Children's Mini-Melts™: 50 mg/packet (12s) [contains phenylalanine 0.6 mg/packet and magnesium 6 mg/packet; grape flavor]

Mucinex® Junior Mini-Melts™: 100 mg/packet (12s) [contains phenylalanine 1 mg/packet and magnesium 10 mg/packet; bubble gum flavor]

Liquid: 100 mg/5 mL (120 mL, 480 mL)

Diabetic Tussin EX®: 100 mg/5 mL (120 mL) [alcohol free, sugar free, dye free; contains phenylalanine 8.4 mg/5 mL]

Ganidin NR: 100 mg/5 mL (480 mL) [raspberry flavor]

Mucinex® Children's: 100 mg/5 mL (120 mL) [alcohol free; grape flavor]

Organidin® NR: 100 mg/5 mL (480 mL) [contains sodium benzoate; raspberry flavor]

Siltussin DAS: 100 mg/5 mL (120 mL) [alcohol free, dye free, sugar free; strawberry flavor]

Syrup: 100 mg/5 mL (120 mL, 480 mL)

Guiatuss™: 100 mg/5 mL (120 mL, 480 mL) [alcohol free; fruit-mint flavor]

Phanasin®: 100 mg/5 mL (120 mL, 240 mL) [alcohol free, sugar free; mint flavor]

Phanasin® Diabetic Choice: 100 mg/5 mL (120 mL) [alcohol free, sugar free; mint flavor]

Robitussin®: 100 mg/5 mL (5 mL, 10 mL, 15 mL, 30 mL, 120 mL, 240 mL, 480 mL) [alcohol free; contains sodium benzoate]

Scot-Tussin® Expectorant: 100 mg/5 mL (120 mL) [alcohol free, dye free, sugar free; contains benzoic acid; grape flavor]

Siltussin SA: 100 mg/5 mL (120 mL, 240 mL, 480 mL) [alcohol free, sugar free; strawberry flavor]

Vicks® Casero™ Chest Congestion Relief: 100 mg/6.25 mL (120 mL, 240 mL) [contains phenylalanine 5.5 mg/12.5 mL, sodium 32 mg/12.5 mL, and sodium benzoate; honey menthol flavor]

Tablet: 200 mg

Allfen Jr: 400 mg [dye free]

Organidin® NR: 200 mg

Refenesen™: 200 mg

XPECT™: 400 mg

Tablet, extended release:

Mucinex®: 600 mg

Mucinex® Maximum Strength: 1200 mg

Generic AvailableYes: Excludes extended release and granules

Pricing: U.S. (www.drugstore.com)

Liquid (Organidin NR)

100 mg/5 mL (120): $52.42

Syrup (Guiatuss)

100 mg/5 mL (473): $11.99

Tablet, 12-hour (Mucinex)

600 mg (20): $18.80

Tablets (Guaifenesin)

200 mg (90): $18.00

Tablets (Organidin NR)

200 mg (30): $25.67

Mechanism of ActionThought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing mucous viscosity

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Half-life elimination: ~1 hour

Excretion: Urine (as unchanged drug and metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsGG; Glycerol Guaiacolate

Guanabenz

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Guanabenz may be confused with guanadrel, guanfacine

Pronunciation(GWAHN a benz)
Canadian Brand NamesWytensin®
Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist
Use: Labeled IndicationsManagement of hypertension
Dosing: AdultsHypertension: Oral: Initial: 4 mg twice daily; increase in increments of 4-8 mg/day every 1-2 weeks to a maximum of 32 mg twice daily.
Dosing: ElderlyInitial: 4 mg once daily, increase every 1-2 weeks
Dosing: Hepatic ImpairmentDosage adjustment is probably necessary; however, no specific guidelines are available.
StorageProtect from light.
ContraindicationsHypersensitivity to guanabenz or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause sedation and drowsiness; avoid use in CNS disease.
- Orthostasis: May cause significant orthostasis.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe coronary insufficiency or recent MI.
- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment.

Concurrent drug therapy issues:

- CNS depressants: Avoid use with other CNS depressants; effects may be potentiated.

Special populations:

- Elderly: Avoid use in the elderly.
- Pediatrics: Safety and efficacy have not been established for use in children <12 years of age.

Other warnings/precautions:

- Abrupt withdrawal: Abrupt discontinuation can result in nervousness, anxiety and rarely, rebound hypertension (occurs 2-4 days after withdrawal).

Geriatric ConsiderationsBecause of its CNS adverse effects, guanabenz is not considered a drug of choice for the treatment of hypertension in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsHigher rates with larger doses

>5% (at doses of 16 mg/day):

Cardiovascular: Orthostasis

Central nervous system: Drowsiness or sedation (39%), dizziness (12% to 17%), headache (5%)

Gastrointestinal: Xerostomia (28% to 38%)

Neuromuscular & skeletal: Weakness (~10%)

≤3% (may be similar to placebo):

Cardiovascular: Arrhythmias, chest pain, edema, palpitation

Central nervous system: Anxiety, ataxia, depression, sleep disturbances

Dermatologic: Pruritus, rash

Endocrine & metabolic: Disturbances of sexual function, gynecomastia, decreased sexual function

Gastrointestinal: Constipation, diarrhea, nausea, vomiting

Genitourinary: Polyuria

Neuromuscular & skeletal: Myalgia

Ocular: Blurring of vision

Respiratory: Dyspnea, nasal congestion

Miscellaneous: Taste disorders

Metabolism/Transport Effects **Substrate** of CYP1A2 (major)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antidepressants (Alpha2-Antagonist): May diminish the hypotensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Alpha2-Agonists may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring Parameters Monitor blood pressure, standing and sitting/supine

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 4 mg, 8 mg

Generic Available Yes

Pricing: U.S. (www.drugstore.com)

Tablets (Guanabenz Acetate)

8 mg (60): $93.99

Mechanism of Action Stimulates alpha$_2$-adrenoreceptors in the brain stem, thus activating an inhibitory neuron, resulting in reduced sympathetic outflow, producing a decrease in vasomotor tone and heart rate

Pharmacodynamics/Kinetics

Onset of action: Antihypertensive: ~1 hour

Absorption: ~75%

Half-life elimination, serum: 7-10 hours

Pharmacotherapy Pearls Considered an alternate to clonidine; it causes less sodium retention than clonidine or methyldopa.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Taste disorder, nasal congestion, dyspnea, significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause anxiety or depression

Mental Health: Effects on Psychiatric TreatmentHas been used to treat ADHD; concurrent use with psychotropics may produce additive sedation and dry mouth; TCAs may decrease the hypotensive effect of guanabenz

Cardiovascular ConsiderationsNot routinely used in clinical practice because of significant and marked orthostatic hypotension.

Anesthesia and Critical Care Concerns/Other ConsiderationsGuanabenz is not routinely used in clinical practice because of significant and marked orthostatic hypotension.

Index TermsGuanabenz Acetate

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children's Healthcare Quality.

GuanFACINE may be confused with guaiFENesin, guanabenz, guanidine

Tenex® may be confused with Entex®, Ten-K®, Xanax®

International issues:

Tenex® may be confused with Kinex® which is a brand name for biperiden in Mexico

Pronunciation(GWAHN fa seen)
U.S. Brand NamesTenex®
Canadian Brand NamesTenex®
Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist
Use: Labeled IndicationsManagement of hypertension
Use: Unlabeled/InvestigationalADHD, tic disorder, aggression
Dosing: Adults

Hypertension: Oral: 1 mg usually at bedtime, may increase if needed at 3- to 4-week intervals; usual dose range (JNC 7): 0.5-2 mg once daily

ADHD, tic disorder, aggression (unlabeled uses): Oral: Initial: 0.5 mg at bedtime; increase as tolerated (every 3-14 days) to usual dose range (1.5-3 mg/day) given in 3 divided doses (maximum: 4 mg/day)

Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to guanfacine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause sedation and drowsiness; avoid use in CNS disease.
- Orthostasis: May cause orthostasis.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe coronary insufficiency or recent MI.
- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease.
- Diabetes: Use with caution in patients with diabetes mellitus; may mask signs of hypoglycemia.
- Hepatic impairment: Use with caution in patients with chronic hepatic impairment.
- Renal impairment: Use with caution in patients with chronic renal impairment.

Concurrent drug therapy issues:

- CNS depressants: Avoid use with other CNS depressants; effects may be potentiated.

Special populations:

- Elderly: Avoid use in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Abrupt withdrawal: Abrupt discontinuation can result in nervousness, anxiety and rarely, rebound hypertension (occurs 2-4 days after withdrawal).

Geriatric ConsiderationsBecause of adverse effects such as CNS depression, dry mouth, and constipation, guanfacine may not be considered a drug of choice in the elderly.
Pregnancy Risk FactorB
Adverse Reactions

>10%:

Central nervous system: Somnolence (5% to 40%), headache (3% to 13%), dizziness (2% to 15%)

Gastrointestinal: Xerostomia (10% to 54%), constipation (2% to 15%)

1% to 10%:

Central nervous system: Fatigue (2% to 10%)

Endocrine & metabolic: Impotence (up to 7%)

<1% (Limited to important or life-threatening): Agitation, alopecia, amnesia, blurred vision, bradycardia, chest pain, confusion, depression, dermatitis, diaphoresis, dysphagia, dyspnea, edema, exfoliative dermatitis, hypokinesia, hypotension, insomnia, leg cramps, malaise, nervousness, orthostasis, palpitation, paresthesia, pruritus, rash, rebound hypertension, syncope, tinnitus, urinary incontinence, vertigo; **Note:** Mania and aggressive behavior have been reported in pediatric patients with ADHD who received guanfacine.

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antidepressants (Alpha2-Antagonist): May diminish the hypotensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Alpha2-Agonists may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersHeart rate, blood pressure
When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure (when started and weaned), and consider obtaining ECG prior to initiation (Vetter, 2008).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2 mg

Tenex®: 1 mg, 2 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Guanfacine HCl)

1 mg (30): $20.99

2 mg (30): $25.99

Mechanism of ActionStimulates alpha$_2$-adrenoreceptors in the brain stem, thus activating an inhibitory neuron, resulting in reduced sympathetic outflow, producing a decrease in vasomotor tone and heart rate
Pharmacodynamics/Kinetics

Onset of action: Peak effect: 8-11 hours

Duration: 24 hours following single dose

Half-life elimination, serum: 17 hours

Time to peak, serum: 1-4 hours

Pharmacotherapy PearlsMore selective alpha$_2$ agonist than clonidine; withdrawal effects rarely occur due to its long half-life.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common; may cause insomnia or dizziness, may rarely cause confusion or depression
Mental Health: Effects on Psychiatric TreatmentHas been used to treat ADHD; concurrent use with psychotropics may produce additive sedation and dry mouth; TCAs may decrease the hypotensive effect of guanfacine
Cardiovascular ConsiderationsNot routinely used in clinical practice because of significant and marked hypotension.

Anesthesia and Critical Care Concerns/Other Considerations Guanfacine is not routinely used in clinical practice because of significant and marked hypotension.

Index Terms Guanfacine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Comvax® may be confused with Recombivax [Recombivax HB®]

Pronunciation(he MOF i lus bee KON joo gate & hep a TYE tis bee vak SEEN)

U.S. Brand NamesComvax®

Pharmacologic CategoryVaccine, Inactivated (Bacterial); Vaccine, Inactivated (Viral)

Use: Labeled Indications

Immunization against invasive disease caused by *H. influenzae* type b and against infection caused by all known subtypes of hepatitis B virus in infants 6 weeks to 15 months of age born of hepatitis B surface antigen (HB$_S$Ag) negative mothers

Infants born of HB$_S$Ag-positive mothers or mothers of unknown HB$_S$Ag status should receive hepatitis B immune globulin and hepatitis B vaccine (recombinant) at birth and should complete the hepatitis B vaccination series given according to a particular schedule

Dosing: Pediatric

Immunization: Infants: I.M.: 0.5 mL at 2, 4, and 12-15 months of age (total of 3 doses). **Note:** If the recommended schedule cannot be followed, the interval between the first two doses should be at least 6 weeks and the interval between the second and third dose should be as close as possible to 8-11 months. Minimum age for first dose is 6 weeks.

Modified Schedule: Children who receive one dose of hepatitis B vaccine at or shortly after birth may receive Comvax® on a schedule of 2, 4, and 12-15 months of age

Administration: I.M.Shake well prior to use. Administer 0.5 mL I.M. into anterolateral thigh [data suggests that injections given in the buttocks frequently are given into fatty tissue instead of into muscle to result in lower seroconversion rates]; **do not administer intravenously, intradermally, or subcutaneously.**

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Haemophilus b conjugate and Hepatitis B vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Haemophilus b conjugate and Hepatitis B vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products:*Haemophilus* b conjugate and Hepatitis B vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

StorageStore at 2°C to 8°C (36°F to 48°F); do not freeze.

ContraindicationsHypersensitivity to *Haemophilus* b vaccine, hepatitis B vaccine, yeast, or to any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. May be used in patients with HIV infection.

Dosage form specific issues:

- Latex: Packaging contains natural latex rubber.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. This product is not indicated for use in women of childbearing age.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Irritability (32% to 57%), somnolence (21% to 50%), fever (101°F to 102.9°F: 11% to 14%), crying (unusual/high pitched: 3% to 11%)

Local: Injection site reactions: Pain/soreness (24% to 35%), swelling/induration (<1 inch: 27% to 30%), erythema (<1 inch: 22% to 27%)

1% to 10%:

Central nervous system: Fever (≥103°F: <1% to 3%), crying (<1% to 2%)

Dermatologic: Rash (≤1%)

Gastrointestinal: Anorexia (<1% to 4%), vomiting (1% to 3%), diarrhea (<1% to 2%), oral candidiasis (≤1%)

Local: Injection site reactions: Erythema (>1 inch: 1% to 3%), swelling/induration (>1 inch: 3% to 4%)

Otic: Otitis media (<1% to 3%)

Respiratory: cough (≤1%), respiratory congestion (≤1%), rhinorrhea (≤1%), upper respiratory tract infection (≤1%)

Postmarketing and/or case reports: Anaphylaxis, angioedema, erythema multiforme, febrile seizure, seizure, thrombocytopenia, urticaria

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

Comvax®: *Haemophilus* b capsular polysaccharide 7.5 mcg (bound to *Neisseria meningitides* OMPC 125 mcg) and hepatitis B surface antigen 5 mcg per 0.5 mL (0.5 mL) [contains aluminum; contains natural rubber/natural latex in packaging]

Generic AvailableNo

Medication Safety Issues

Sound-alike/look-alike issues:

International issues:

Hiberix is also a brand name for influenza virus vaccine in multiple international markets

Pronunciation(he MOF fi lus bee KON joo gate vak SEEN)

U.S. Brand NamesActHIB®; PedvaxHIB®

Canadian Brand NamesActHIB®; PedvaxHIB®

Pharmacologic CategoryVaccine, Inactivated (Bacterial)

Use: Labeled IndicationsRoutine immunization of children against invasive disease caused by *H. influenzae* type b

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination of all children through age 59 months. Efficacy data is not available for use in older children and adults with chronic conditions associated with an increased risk of Hib disease. However, a single dose may also be considered for older children, adolescents, and adults who did not receive the childhood series and who have had splenectomies or who have sickle cell disease, leukemia or HIV infection.

Dosing: PediatricImmunization: I.M.: 0.5 mL as a single dose should be administered to previously unvaccinated children according to one of the following “brand-specific” schedules; number of doses in series is dependent upon age at first dose

ActHIB®:*Age at first dose:*

2 months of age: Immunization consists of 3 doses (0.5 mL/dose) administered at 2-, 4- and 6 months of age (may reconstitute with provided diluent or DTP vaccine). A booster dose is given at 15-18 months of age (may reconstitute with provided diluent or Tripedia® vaccine).

7-11 months of age: Two doses (0.5 mL/dose) administered 8 months apart, with a booster dose at 15-18 months of age

12-14 months of age: One dose (0.5 mL) followed by a booster dose 2 months later

PedvaxHIB®:*Age at first dose:*

2-10 months of age: Two doses (0.5 mL/dose) administered 2 months apart; booster dose at 12-15 months of age

11-14 months of age: Two doses (0.5 mL/dose) administered 1 months apart

15-71 months of age: One 0.5 mL dose

Administration: I.M.For I.M. administration; do not inject I.V.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Haemophilus b conjugate vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Haemophilus b conjugate vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products:*Haemophilus* b conjugate vaccine may ay be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze.

ActHIB®: Use within 24 hours following reconstitution with saline. Use within 30 minutes following reconstitution with Tripedia®.

ContraindicationsHypersensitivity to *Haemophilus* b polysaccharide vaccine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. May be used in patients with HIV infection.

- Children in whom DTP or DT vaccination is deferred: The carrier proteins used in PRP-T (but not PRP-OMP) are chemically and immunologically related to toxoids contained in DTP vaccine. Earlier or simultaneous vaccination with diphtheria or tetanus toxoids may be required to elicit an optimal anti-PRP antibody response. In contrast, the immunogenicity of PRP-OMP is not affected by vaccination with DTP. In infants in whom DTP or DT vaccination is deferred, PRP-OMP may be advantageous for *Haemophilus influenzae* type b vaccination.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.** Frequency not defined:

Central nervous system: Crying (unusual, high pitched, prolonged), fever, irritability, pain, sleepiness

Dermatologic: Rash

Gastrointestinal: Anorexia, diarrhea, vomiting

Local: Injection site: Erythema, induration, pain, soreness, swelling, warmth

Otic: Otitis media

Respiratory: Upper respiratory tract infection

Postmarketing and/or case reports: Anaphylactoid reactions, angioedema, erythema multiforme, facial edema, febrile seizure, Guillain-Barré syndrome, headache, hypersensitivity, hyporesponsive episodes, hypotonia, inflammation, injection site abscess (sterile), lethargy, lymphadenopathy, malaise, mass, seizure, shock, skin discoloration, urticaria

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Test InteractionsMay interfere with interpretation of antigen detection tests; antigenuria may occur up to 2 weeks following immunization

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

ActHIB® *Haemophilus* b capsular polysaccharide 10 mcg (bound to tetanus toxoid 24 mcg) per 0.5 mL [contains sucrose; may be reconstituted with provided diluent (forms solution; contains natural rubber/natural latex in packaging) or Tripedia® (forms suspension)]

Injection, suspension:

PedvaxHIB®: *Haemophilus* b capsular polysaccharide 7.5 mcg [bound to *Neisseria meningitidis* OMPC 125 mcg] per 0.5 mL (0.5 mL) [contains aluminum]

Generic AvailableNo

Mechanism of ActionStimulates production of anticapsular antibodies and provides active immunity to *Haemophilus influenzae* type b

Pharmacodynamics/KineticsSeroconversion following one dose of Hib vaccine for children 18 months or 24 months of age or older is 75% to 90%, respectively.

Onset of action: Serum antibody response: 1-2 weeks

Duration: Immunity: 1.5 years

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

The two conjugate vaccines currently available consist of *Haemophilus influenzae* type b (Hib) capsular polysaccharide (also referred to as PRP) linked to a carrier protein. PedvaxHIB® (PRP-OMP) is linked to the outer membrane protein complex from *Neisseria meningitidis*. ActHIB® (PRP-T) uses tetanus toxoid conjugate as the carrier protein.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause irritability or lethargy
Mental Health: Effects on Psychiatric TreatmentMay lessen or potentiate the effects of anxiolytics or mood stabilizers
Index Terms*Haemophilus* b Oligosaccharide Conjugate Vaccine; *Haemophilus* b Polysaccharide Vaccine; Diphtheria Toxoid Conjugate; HbCV; Hib Conjugate Vaccine; Hib Polysaccharide Conjugate; PRP-OMP; PRP-T

Halcinonide may be confused with Halcion®

Halog® may be confused with Haldol®, Mycolog®

Pronunciation(hal SIN oh nide)

U.S. Brand NamesHalog®

Canadian Brand NamesHalog®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsInflammation of corticosteroid-responsive dermatoses [high potency topical corticosteroid]

Dosing: AdultsSteroid-responsive dermatoses: Topical: Apply sparingly 1-3 times/day, occlusive dressing may be used for severe or resistant dermatoses; a thin film is effective; do not overuse. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

ContraindicationsHypersensitivity to halcinonide or any component of the formulation; viral, fungal, or tubercular skin lesions

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Adverse Reactions

Frequency not defined.

Dermatologic: Acneiform eruptions, allergic contact dermatitis, dry skin, folliculitis, hypertrichosis, itching, miliaria, perioral dermatitis, skin atrophy, skin maceration, striae

Local: Burning, itching

Miscellaneous: Secondary infection

Reported with other topical corticosteroids, may occur more frequently with occlusive dressings: Cushing’s syndrome, glucosuria, growth retardation (children), HPA axis suppression, hyperglycemia, intracranial hypertension (children)

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess patient response. Teach patient proper use (according to formulation), side effects/appropriate interventions, and symptoms to report.

Patient EducationFor external use only. Do not use for eyes, mucous membranes, or open wounds. Use exactly as directed and for no longer than the period prescribed. Before using, wash and dry area gently. Apply in a thin layer (may rub in lightly). Apply light dressing (if necessary) to area being treated. Do not use occlusive dressing unless so advised by prescriber. Avoid prolonged or excessive use around sensitive tissues, genital, or rectal areas. Avoid exposing treated area to direct sunlight. Inform prescriber if condition worsens (redness, swelling, irritation, signs of infection, or open sores) or fails to improve. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Canadian Brand NamesUltravate®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsRelief of inflammatory and pruritic manifestations of corticosteroid-response dermatoses [super high potency topical corticosteroid]

Use: DentalRelief of inflammatory and pruritic manifestations (super high potency topical corticosteroid)

Dosing: Adults**Inflammatory and pruritic manifestations (dental use):** Cream: Apply sparingly to lesion twice daily. Treatment should not exceed 2 consecutive weeks and total dosage should not exceed 50 g/week. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.**Steroid-responsive dermatoses:** Topical: Apply sparingly to skin twice daily, rub in gently and completely; treatment should not exceed 2 consecutive weeks and total dosage should not exceed 50 g/week. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

Administration: TopicalUse of occlusive dressings is not recommended. Do not apply to the face, groin, or axillae. Apply thin film to affected area and rub in completely.

ContraindicationsHypersensitivity to halobetasol or any component of the formulation; viral, fungal, or tubercular skin lesions

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Periorbital dermatitis: Should not be used for the treatment of perioral dermatitis.
- Rosacea: Should not be used for the treatment of rosacea.

Special populations:

- Pediatrics: Safety and efficacy have not been established in pediatric patients; use in children <12 years of age is not recommended.

Other warnings/precautions:

- Application site: Not for ophthalmic use. Not recommended for application to the face, groin, or axillae.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women, however, halobetasol is teratogenic in animals; use during pregnancy with caution. Increased incidence of cleft palate, neonatal adrenal suppression, low birth weight, and cataracts in the infant have been reported following corticosteroid use during pregnancy. In general, the use of large amounts, or prolonged use, of topical corticosteroids during pregnancy should be avoided.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSystemically administered corticosteroids appear in human milk and may cause adverse effects in a nursing infant. It is not known if the systemic absorption of topical halobetasol results in detectable quantities in human milk.

Adverse Reactions

1% to 4%: Dermatologic: Burning, itching, stinging

<1%: Acneiform eruptions, allergic contact dermatitis, dry skin, erythema, HPA axis suppression, hypopigmentation, leukoderma, miliaria, perioral dermatitis, pustulation, rash, secondary infection, skin atrophy, striae, vesicles

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient Education

A thin film of cream or ointment is effective; do not overuse. Use only as prescribed, and for no longer than the period prescribed. Apply sparingly in a light film and rub in lightly. Avoid contact with eyes. Notify prescriber if condition being treated persists or worsens. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Pronunciation(ha loe PER i dole)

U.S. Brand NamesHaldol®; Haldol® Decanoate

Canadian Brand NamesApo-Haloperidol LA®; Apo-Haloperidol®; Haloperidol Injection, USP; Haloperidol Long Acting; Haloperidol-LA; Haloperidol-LA Omega; Novo-Peridol; Peridol; PMS-Haloperidol LA

Pharmacologic CategoryAntipsychotic Agent, Typical

Use: Labeled IndicationsManagement of schizophrenia; control of tics and vocal utterances of Tourette's disorder in children and adults; severe behavioral problems in children

Use: Unlabeled/InvestigationalTreatment of non-schizophrenia psychosis; may be used for the emergency sedation of severely-agitated or delirious patients; adjunctive treatment of ethanol dependence; antiemetic; psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Psychosis:

Oral: 0.5-5 mg 2-3 times/day; usual maximum: 30 mg/day

I.M. (as lactate): 2-5 mg every 4-8 hours as needed

I.M. (as decanoate): Initial: 10-20 times the daily oral dose administered at 4-week intervals. Maintenance dose: 10-15 times initial oral dose; used to stabilize psychiatric symptoms

Delirium in the intensive care unit (unlabeled use, unlabeled route):

I.V.: 2-10 mg; may repeat bolus doses every 20-30 minutes until calm achieved then administer 25% of the maximum dose every 6 hours; monitor ECG and QT_c interval

Intermittent I.V.: 0.03-0.15 mg/kg every 30 minutes to 6 hours

Oral: Agitation: 5-10 mg

Continuous I.V. infusion (100 mg/100 mL D_5W): Rates of 3-25 mg/hour have been used

Rapid tranquilization of severely-agitated patient (unlabeled use; administer every 30-60 minutes):

Oral: 5-10 mg

I.M. (as lactate): 5 mg

Average total dose (oral or I.M.) for tranquilization: 10-20 mg

Dosing: ElderlyNonpsychotic patient, dementia behavior (unlabeled use): Initial: Oral: 0.25-0.5 mg 1-2 times/day; increase dose at 4- to 7-day intervals by 0.25-0.5 mg/day. Increase dosing intervals (twice daily, 3 times/day, etc) as necessary to control response or side effects.

Dosing: Pediatric

Sedation/psychotic disorders: Oral:

Children 3-12 years (15-40 kg): Initial: 0.05 mg/kg/day or 0.25-0.5 mg/day given in 2-3 divided doses; increase by 0.25-0.5 mg every 5-7 days; maximum: 0.15 mg/kg/day

Usual maintenance:

Agitation or hyperkinesia: 0.01-0.03 mg/kg/day once daily

Nonpsychotic disorders: 0.05-0.075 mg/kg/day in 2-3 divided doses

Psychotic disorders: 0.05-0.15 mg/kg/day in 2-3 divided doses

Children 6-12 years: Sedation/psychotic disorders: I.M. (as lactate): 1-3 mg/dose every 4-8 hours to a maximum of 0.15 mg/kg/day; change over to oral therapy as soon as able.

Dosing: Renal ImpairmentHemodialysis/peritoneal dialysis: Supplemental dose is not necessary.

Administration: I.M.The decanoate injectable formulation should be administered I.M. only; **do not give decanoate I.V.**

Administration: I.V.

Decanoate: Do **not** administer I.V.

Lactate: Although not an FDA-approved route of administration, Haldol® has been administered by this route in many acute care settings.

Administration: I.V. DetailThe response to I.V. Haldol® may be delayed by several minutes.

pH: 3.0-3.6

Administration: OralDilute the oral concentrate with water or juice before administration. **Note:** Avoid skin contact with oral medication; may cause contact dermatitis.

StorageProtect oral dosage forms from light. Haloperidol lactate injection should be stored at controlled room temperature; do not freeze or expose to temperatures >40°C. Protect from light; exposure to light may cause discoloration and the development of a grayish-red precipitate over several weeks. Stability of standardized solutions is 38 days at room temperature (24°C).

ReconstitutionHaloperidol lactate may be administered IVPB or I.V. infusion in D_5W solutions. NS solutions should not be used due to reports of decreased stability and incompatibility.

Standardized dose: 0.5-100 mg/50-100 mL D_5W.

CompatibilityStable in D_5W; **variable stability (consult detailed reference)** in $D_5{}^1/_4$NS, LR, ${}^1/_2$NS, NS.

Y-site administration: Compatible: Amifostine, amsacrine, aztreonam, cimetidine, cisatracurium, cladribine, dobutamine, docetaxel, dopamine, doxorubicin liposome, etoposide phosphate, famotidine, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, lidocaine, linezolid, lorazepam, melphalan, midazolam, nitroglycerin, norepinephrine ondansetron, paclitaxel, phenylephrine, propofol, remifentanil, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, fluconazole, foscarnet, heparin, piperacillin/tazobactam, sargramostim. **Variable (consult detailed reference):** Sodium nitroprusside.

Compatibility in syringe: Compatible: Hydromorphone, sufentanil. **Incompatible:** Diphenhydramine, heparin, hydroxyzine, ketorolac. **Variable (consult detailed reference):** Benztropine, cyclizine, diamorphine, morphine.

ContraindicationsHypersensitivity to haloperidol or any component of the formulation; Parkinson's disease; severe CNS depression; bone marrow suppression; severe cardiac or hepatic disease; coma

Allergy Considerations

- Butyrophenone Allergy

Warnings/Precautions

Boxed warnings:

- Dementia: See "Disease-related concerns" below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction and prolong QT interval; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics, but risk may be increased with doses exceeding recommendations and/or intravenous administration (unlabeled route). Use with caution or avoid use in patients with electrolyte abnormalities (eg, hypokalemia, hypomagnesemia), hypothyroidism, familial long QT syndrome, concomitant medications which may augment QT prolongation, or any underlying cardiac abnormality which may also potentiate risk. Monitor ECG closely for dose-related QT effects. Adverse effects of decanoate may be prolonged.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, haloperidol has a low potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Haloperidol is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Avoid in thyrotoxicosis.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Dosage form specific issues:

- Tartrazine: Some tablets contain tartrazine.

Other warnings/precautions:

- Parenteral administration: Hypotension may occur, particularly with parenteral administration. Risk of QT prolongation, torsade de pointes, and sudden death appear to be increased with intravenous administration, particularly at higher doses. Although the short-acting form (lactate) is used clinically intravenously, the I.V. use of the injection is not an FDA-approved route of administration; the decanoate form should never be administered intravenously.

Geriatric ConsiderationsMany elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

Any changes in disease status in any organ system can result in behavior changes.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Clinical studies of haloperidol did not include sufficient numbers of subjects ≥65 years of age to determine whether they respond differently from younger subjects. Other reported clinical experience has not consistently identified differences between the elderly and younger patients. However, the prevalence of tardive dyskinesia appears to be highest among the elderly, especially elderly women. Also, the pharmacokinetics of haloperidol in geriatric patients generally warrants the use of lower doses.

Pregnancy Risk FactorC
LactationEnters breast milk/not recommended (AAP rates “of concern”)
Breast-Feeding ConsiderationsDecline in developmental scores may be seen in nursing infants.
Adverse ReactionsFrequency not defined.

Cardiovascular: Abnormal T waves with prolonged ventricular repolarization, arrhythmia, hyper-/hypotension, QT prolongation, sudden death, tachycardia, torsade de pointes

Central nervous system: Agitation, akathisia, altered central temperature regulation, anxiety, confusion, depression, drowsiness, dystonic reactions, euphoria, extrapyramidal reactions, headache, insomnia, lethargy, neuroleptic malignant syndrome (NMS), pseudoparkinsonian signs and symptoms, restlessness, seizure, tardive dyskinesia, tardive dystonia, vertigo

Dermatologic: Alopecia, contact dermatitis, hyperpigmentation, photosensitivity (rare), pruritus, rash

Endocrine & metabolic: Amenorrhea, breast engorgement, galactorrhea, gynecomastia, hyper-/hypoglycemia, hyponatremia, lactation, mastalgia, menstrual irregularities, sexual dysfunction

Gastrointestinal: Anorexia, constipation, diarrhea, dyspepsia, hypersalivation, nausea, vomiting, xerostomia

Genitourinary: Priapism, urinary retention

Hematologic: Cholestatic jaundice, obstructive jaundice

Ocular: Blurred vision

Respiratory: Bronchospasm, laryngospasm

Miscellaneous: Diaphoresis, heat stroke

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP2D6 (moderate), 3A4 (moderate)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Haloperidol. *Risk D: Consider therapy modification*

ChlorproMAZINE: Haloperidol may enhance the QTc-prolonging effect of ChlorproMAZINE. ChlorproMAZINE may decrease the metabolism of Haloperidol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: May increase the serum concentration of Haloperidol. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS); ECG (with off-label intravenous administration)

Reference Range

Therapeutic: 5-20 ng/mL (SI: 10-40 nmol/L) (psychotic disorders - less for Tourette's and mania)

Toxic: >42 ng/mL (SI: >84 nmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions (especially drugs metabolized by P450 enzymes). Review ophthalmic screening. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. With I.M. or I.V. use, monitor for hypotension and cardiac irregularities. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Dilute oral concentration with water or juice. Do not take within 2 hours of any antacid. Store away from light. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid skin contact with medication; may cause contact dermatitis (wash immediately with warm, soapy water). You may experience excess drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); or decreased perspiration (avoid strenuous exercise in hot environments). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; vision changes; skin rash or yellowing of skin; respiratory difficulty; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Note: Strength expressed as base.

Injection, oil, as decanoate: 50 mg/mL (1 mL, 5 mL); 100 mg/mL (1 mL, 5 mL)

Haldol® Decanoate: 50 mg/mL (1 mL; 5 mL [DSC]); 100 mg/mL (1 mL; 5 mL [DSC]) [contains benzyl alcohol, sesame oil]

Injection, solution, as lactate: 5 mg/mL (1 mL, 10 mL)

Haldol®: 5 mg/mL (1 mL)

Solution, oral concentrate, as lactate: 2 mg/mL (15 mL, 120 mL)

Tablet: 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Haldol Decanoate)

100 mg/mL (5): $378.99

Solution (Haloperidol Decanoate)

100 mg/mL (5): $184.99

Tablets (Haloperidol)

0.5 mg (90): $17.00

1 mg (90): $19.99

2 mg (90): $18.99

5 mg (90): $25.99

10 mg (60): $72.26

20 mg (60): $124.07

Mechanism of ActionHaloperidol is a butyrophenone antipsychotic which blocks postsynaptic mesolimbic dopaminergic D_1 and D_2 receptors in the brain; depresses the release of hypothalamic and hypophyseal hormones; believed to depress the reticular activating system thus affecting basal metabolism, body temperature, wakefulness, vasomotor tone, and emesis

Pharmacodynamics/Kinetics

Onset of action: Sedation: I.M., I.V.: 30-60 minutes

Duration: Decanoate: 2-4 weeks

Distribution: V_d: 8-18 L/kg; crosses placenta; enters breast milk

Protein binding: 90%

Metabolism: Hepatic to inactive compounds

Bioavailability: Oral: 60%

Half-life elimination: 18 hours; Decanoate: ~1 day

Time to peak, serum: Oral: 2-6 hours; I.M.: 20 minutes; Decanoate: 7 days

Excretion: Urine (33% to 40% as metabolites) within 5 days; feces (15%)

Clearance: 550 ± 133 mL/minute

- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Orthostatic hypotension, and nasal congestion are possible; since the drug is a dopamine antagonist, extrapyramidal symptoms of the TMJ are a possibility.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsManufacturer's information states that haloperidol may block vasopressor activity of epinephrine. This has not been observed during use of epinephrine as a vasoconstrictor in local anesthesia. Haloperidol is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health CommentHaloperidol is a high-potency antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Long-acting dosage form is useful in patients nonadherent to treatment.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Cardiovascular ConsiderationsHypotension may occur, particularly with parenteral administration. Tachycardic arrhythmias and QT interval prolongation may also occur. When used at recommended doses, cardiac arrhythmias have occurred.

Anesthesia and Critical Care Concerns/Other Considerations

Delirium in the ICU Patient: Set goals for control of delirium. Haloperidol has not been studied in well-controlled trials enrolling ICU patients with acute delirium or agitation. The FDA and Johnson and Johnson have recently (September, 2007) informed healthcare providers about an increased risk of QT prolongation, torsade de pointes (TdP), and sudden death associated with haloperidol use, particularly high dose, intravenous administration (unlabeled use). Case-control studies indicate a dose-response between intravenous haloperidol and TdP. Even when used at recommended doses, cardiac arrhythmias have occurred. Caution or avoidance of haloperidol is advised in patients with predisposing risk factors including electrolyte abnormalities (eg, hypokalemia, hypomagnesemia), hypothyroidism, familial long QT syndrome, concomitant medications which may augment QT prolongation, or any underlying cardiac abnormality which may also potentiate risk. In addition, ECG monitoring is recommended with off-label intravenous use of haloperidol.

Haloperidol may cause extrapyramidal symptoms. It is the most frequently implicated antipsychotic associated with neuroleptic malignant syndrome.

Index Terms Haloperidol Decanoate; Haloperidol Lactate

Halothane

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Halothane may be confused with Halotestin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(HA loe thane)

Pharmacologic CategoryGeneral Anesthetic, Inhalation

Use: Labeled IndicationsInduction and maintenance of general anesthesia

Dosing: AdultsAnesthesia: Inhalation: Minimum alveolar concentration (MAC), the concentration at which 50% of patients do not respond to surgical incision, is 0.74% for halothane. The concentration at which amnesia and loss of awareness occur (MAC - awake) is 0.41%. Surgical levels of anesthesia are maintained with concentrations between 0.5% to 2%; inspired concentrations of up to 3% required for induction of anesthesia. MAC is reduced in the elderly.

Dosing: ElderlyMAC is reduced in the elderly.

Administration: InhalationVia halothane-specific calibrated vaporizer

StorageHalothane mixed with oxygen or air is not flammable or explosive.

ContraindicationsHypersensitivity to halothane or any component of the formulation; known or suspected history of malignant hyperthermia; history of hepatitis after a previous anesthetic

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular effects: Decrease in blood pressure is dose dependent, due to myocardial depression and blunting of the baroreceptor mediated tachycardic response to hypotension. Sinus bradycardia, wandering pacemaker, and junctional rhythm are not uncommon.
- Decreased blood flow: May cause decrease in hepatic, renal and splenic blood flow.
- Hepatitis: Induces hepatic microsomal enzymes function. Incidence of halothane-induced hepatitis is 1/10,000 to 1/30,000 anesthetics (less in children); it most often occurs following repeat administration (etiology is likely immune-mediated, mortality is 50%).
- Hyperkalemia: Use of other inhaled anesthetics has been associated with rare cases of perioperative hyperkalemia; concomitant use of succinylcholine was associated with many of the reported cases, but not all. Risk of hyperkalemia is increased in pediatric patients with underlying neuromuscular disease (eg, Duchenne muscular dystrophy). Other abnormalities may include elevation in CPK and myoglobinuria. Monitor closely for arrhythmias. Aggressively identify and treat hyperkalemia.
- Increased intracranial pressure: Dilates the cerebral vasculature and may, in certain conditions, increase intracranial pressure.
- Malignant hyperthermia: May trigger malignant hyperthermia; avoid use in patients susceptible to malignant hyperthermia.
- Respiratory depression: Respiration is depressed (increase $PaCO_2$ at 1 MAC to 45 mm Hg with spontaneous ventilation). Hypoxic pulmonary vasoconstriction is depressed which may lead to increased pulmonary shunt. Hypoxemia-induced increase in ventilation is abolished at low halothane concentration. Can produce elevated carbon monoxide levels in the presence of a dry carbon dioxide absorbent within the circle breathing system of an anesthetic machine.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypotension, myocardial depression, reflex tachycardia, ventricular or supraventricular arrhythmias

Central nervous system: Agitation, restlessness

Gastrointestinal: Nausea, vomiting

Respiratory: Hypoxemia, respiratory depression/arrest

Miscellaneous: Shivering

Metabolism/Transport Effects**Substrate** of CYP2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (minor), 2E1 (major), 3A4 (minor)

Drug Interactions

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP2E1 Inhibitors (Strong): May decrease the metabolism of CYP2E1 Substrates. *Risk D: Consider therapy modification*

EPINEPHrine: Inhalational Anesthetics may enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Methylphenidate: May enhance the hypertensive effect of Inhalational Anesthetics. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): Inhalational Anesthetics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, heart rate and rhythm, temperature, oxygen saturation, end-tidal CO_2 and end-tidal halothane concentrations should be monitored prior to and throughout anesthesia.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid: 125 mL [DSC], 250 mL [DSC]

Generic AvailableYes

Pharmacodynamics/Kinetics

Onset of action: 1.5-3 minutes

Duration: Emergence time: Depends on blood concentration when halothane is discontinued

Metabolism: Hepatic (20% to 50%) via CYP, both oxidatively and reductively

Excretion: Exhaled gases within 24 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation or restlessness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with benzodiazepines decrease the minimum alveolar concentration of halothane. Disulfiram may increase levels of halothane via enzyme inhibition.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(HEE min)

U.S. Brand NamesPanhematin®

Pharmacologic CategoryBlood Modifiers

Use: Labeled IndicationsTreatment of recurrent attacks of acute intermittent porphyria (AIP)

Dosing: AdultsPorphyria (AIP): I.V.: 1-4 mg/kg/day administered over 10-15 minutes for 3-14 days; may be repeated no earlier than every 12 hours; not to exceed 6 mg/kg in any 24-hour period

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Porphyria (AIP): Children ≥16 years: I.V.: Refer to adult dosing.

Administration: I.V.Infuse over 10-15 minutes using a 0.45 micron or smaller filter. Administer through a large vein or central line to prevent phlebitis.

StorageUndergoes rapid chemical decomposition in solution; prepare immediately before administration. Prior to reconstitution, store vials at 2°C to 8°C (36°F to 46°F).

ReconstitutionImmediately before use, reconstitute each vial with 43 mL sterile water for injection, resulting in a final concentration of 7 mg/mL. Shake well for 2-3 minutes to dissolve.

ContraindicationsHypersensitivity to hemin or any component of the formulation; porphyria cutanea tarda

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Porphyria: Appropriate use: See “Disease-related concerns” below.

Disease-related concerns:

- Porphyria: Appropriate use: **[U.S. Boxed Warning]: Should only be used after an appropriate period of alternate therapy (carbohydrate loading) has been tried.** Intended to prevent porphyria attacks from becoming critical; not intended to repair neuronal damage resulting from attacks.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to Ovation Pharmaceuticals at 1-800-455-1141.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in the management of porphyrias.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit out weighs the potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Central nervous system: Pyrexia

Hematologic: Leukocytosis

Local: Phlebitis

Postmarketing and/or case reports: Coagulopathy, fibrin split products increased, hematocrit decreased, hypofibrogenemia, prothrombin time increased, partial thromboplastin time increased, thrombocytopenia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersUrinary levels of delta-aminolevulinic acid (ALA), uroporphyrinogen (UPG), porphobilinogen (PBG), coproporphyrin

Monitoring: Lab TestsUrinary levels of delta-aminolevulinic acid (ALA), uroporphyrinogen (UPG), porphobilinogen (PBG), coproporphyrin
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Panhematin®: 313 mg [provides 7 mg/mL when reconstituted]

Generic AvailableNo
ManufacturerOvation Pharmaceuticals Inc
Mechanism of ActionInhibits the hepatic and/or marrow synthesis of ALA synthase, the enzyme that regulates the porphyrin/heme pathway
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentAvoid concurrent use with barbiturates
Index TermsHematin

Special Alerts

Heparin Sodium Recall Updated - April 3, 2008

The U.S. Food and Drug Administration (FDA) is alerting healthcare professionals that Covidien (formerly Tyco Healthcare), has initiated a voluntary recall of heparin sodium prefilled syringes from the U.S. market. This recall follows notification from the manufacturer's supplier, Scientific Protein Laboratories LLC (SPL) that a heparin-like contaminant (previously identified as oversulfated chondroitin sulfate) was present in two lots of heparin sodium USP acquired by Covidien. This announcement follows previously announced recalls of heparin sodium products by Baxter Healthcare and the FDA (single-use and multidose vials, lock flush solutions) from U.S. markets, and by B. Braun Medical Inc, along with the FDA and Health Canada (premixed heparin sodium solutions) from U.S. and Canadian markets, respectively. In each case, all recalled heparin sodium products were supplied by SPL.

Serious adverse events have been reported to Baxter Healthcare and include hypersensitivity reactions (eg, severe hypotension, oral swelling, shortness of breath, nausea, and vomiting) that generally occur within minutes after administering intravenous bolus doses of heparin sodium largely associated with the multiple-dose vials. However, reactions have also been associated with use of single-dose vials. No adverse events have been reported to Covidien or B. Braun Medical Inc.

Patients receiving medically necessary intravenous bolus doses of heparin should be monitored closely for adverse events, especially signs of hypersensitivity. Equipment for resuscitation and trained personnel experienced in handling emergencies should always be immediately available. Whenever possible, infusions of heparin should be instituted without a bolus or the lowest possible bolus dose should be used. Use of pretreatment corticosteroids or antihistamines before heparin has not been determined to be of benefit at this time. Use of other anticoagulants (eg, direct thrombin inhibitors, low molecular weight heparins) should be used only if heparin is unavailable and the indication is appropriate.

Medication Safety Issues

Sound-alike/look-alike issues:

Heparin may be confused with Hespan®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Heparin sodium injection 10,000 units/mL and Hep-Lock U/P 10 units/mL have been confused with each other. Fatal medication errors have occurred between the two whose labels are both blue. **Never rely on color as a sole indicator to differentiate product identity.**

Heparin lock flush solution is intended only to maintain patency of I.V. devices and is **not** to be used for anticoagulant therapy.

Note: The 100 unit/mL concentration should not be used in neonates or infants <10 kg. The 10 unit/mL concentration may cause systemic anticoagulation in infants <1 kg who receive frequent flushes.

2009 National Patient Safety Goals: The Joint Commission on Accreditation of Healthcare Organizations requires healthcare organizations that provide anticoagulant therapy to have a process in place to reduce the risk of anticoagulant-associated patient harm. Patients receiving anticoagulants should receive individualized care through a defined process that includes standardized ordering, dispensing, administration, monitoring and education. This does not apply to routine short-term use of anticoagulants for prevention of venous thromboembolism when the expectation is that the patient's laboratory values will remain within or close to normal values (NPSG.03.05.01).

Pronunciation(HEP a rin)

U.S. Brand NamesHep-Lock U/P; Hep-Lock®; HepFlush®-10

Canadian Brand NamesHepalean®; Hepalean® Leo; Hepalean®-LOK

Pharmacologic CategoryAnticoagulant

Use: Labeled IndicationsProphylaxis and treatment of thromboembolic disorders; as an anticoagulant for extracorporeal and dialysis procedures

Note: Heparin lock flush solution is intended only to maintain patency of I.V. devices and is **not** to be used for anticoagulant therapy.

Use: Unlabeled/InvestigationalST-elevation myocardial infarction (STEMI) - combination regimen of heparin (unlabeled dose), tenecteplase (half dose), and abciximab (full dose)

Dosing: Adults**Note:** Many concentrations of heparin are available ranging from 1 unit/mL to 20,000 units/mL. Carefully examine each prefilled syringe or vial prior to use ensuring that the correct concentration is chosen. Heparin lock flush solution is intended only to maintain patency of I.V. devices and is not to be used for anticoagulant therapy.

DVT Prophylaxis (low-dose heparin): SubQ: 5000 units every 8-12 hours

Systemic anticoagulation: I.V. infusion (weight-based dosing per institutional nomogram recommended):

Acute coronary syndromes: I.V. infusion:

Percutaneous coronary intervention:

If no concurrent GPIIb/IIIa inhibitor: Initial bolus of 60-100 units/kg (target ACT 250-350 seconds)

or

If receiving GPIIb/IIIa inhibitor: Initial bolus of 50-70 units/kg (target ACT 200-250 seconds)

STEMI: Fibrinolytic therapy:

Full-dose alteplase, reteplase, or tenecteplase with dosing as follows: Concurrent bolus of 60 units/kg (maximum: 4000 units), then 12 units/kg/hour (maximum: 1000 units/hour) as continuous infusion. Check aPTT every 4-6 hours; adjust to target of 1.5-2 times the upper limit of control (50-70 seconds in clinical trials); usual range 10-30 units/kg/hour. Duration of heparin therapy depends on concurrent therapy and the specific patient risks for systemic or venous thromboembolism.

Combination regimen (unlabeled): Half-dose tenecteplase (15-25 mg based on weight) and abciximab 0.25 mg/kg bolus then 0.125 mcg/kg/minute (maximum 10 mcg/minute) for 12 hours with heparin dosing as follows: Concurrent bolus of 40 units/kg (maximum 3000 units), then 7 units/kg/hour (maximum: 800 units/hour) as continuous infusion. Adjust to a aPTT target of 50-70 seconds.

Unstable angina/Non-ST-elevation myocardial infarction (NSTEMI): Initial bolus of 60 units/kg (maximum: 4000 units), followed by an initial infusion of 12 units/kg/hour (maximum: 1000 units/hour). The American College of Chest Physicians consensus conference has recommended dosage adjustments to correspond to a therapeutic range equivalent to heparin levels of 0.3-0.7 units/mL by antifactor Xa determinations.

Treatment of venous thromboembolism:

DVT/PE: I.V.: 80 units/kg (or 5000 units) I.V. push followed by continuous infusion of 18 units/kg/hour (or 1300 units/hour). The American College of Chest Physicians consensus conference has recommended dosage adjustments to correspond to a therapeutic range equivalent to heparin levels of 0.3-0.7 units/mL by antifactor Xa determinations.

DVT/PE: SubQ:

Monitored dosing regimen: Initial: 17,500 units or 250 units/kg then 250 units/kg every 12 hours. The American College of Chest Physicians consensus conference has recommended dosage adjustments to correspond to a therapeutic range equivalent to heparin levels of 0.3-0.7 units/mL by antifactor Xa determinations.

Unmonitored dosing regimen: Initial: 333 units/kg then 250 units/kg every 12 hours

Intermittent I.V. Anticoagulation: Intermittent I.V.: Initial: 10,000 units, then 50-70 units/kg (5000-10,000 units) every 4-6 hours

Maintenance of line patency (line flushing): When using daily flushes of heparin to maintain patency of single and double lumen central catheters, 10 units/mL is commonly used for younger infants (eg, <10 kg) while 100 units/mL is used for older infants, children, and adults. Capped PVC catheters and peripheral heparin locks require flushing more frequently (eg, every 6-8 hours). Volume of heparin flush is usually similar to volume of catheter (or slightly greater). Additional flushes should be given when stagnant blood is observed in catheter, after catheter is used for drug or blood administration, and after blood withdrawal from catheter.

Parenteral nutrition: Addition of heparin (0.5-3 unit/mL) to peripheral and central parenteral nutrition has not been shown to decrease catheter-related thrombosis. The final concentration of heparin used for TPN solutions may need to be decreased to 0.5 units/mL in small infants receiving larger amounts of volume in order to avoid approaching therapeutic amounts. Arterial lines are heparinized with a final concentration of 1 unit/mL.

Dosing: ElderlyPatients >60 years of age may have higher serum levels and clinical response (longer aPTTs) as compared to younger patients receiving similar dosages. Lower dosages may be required.
Dosing: Pediatric**Note:** Many concentrations of heparin are available ranging from 1 unit/mL to 20,000 units/mL. Carefully examine each prefilled syringe or vial prior to use ensuring that the correct concentration is chosen. Heparin lock flush solution is intended only to maintain patency of I.V. devices and is not to be used for anticoagulant therapy.

Prophylaxis for cardiac catheterization (arterial approach): I.V.: Bolus: 100-150 units/kg (Monagle, 2008)

Systemic heparinization:

Intermittent I.V.: Initial: 50-100 units/kg, then 50-100 units/kg every 4 hours (**Note:** Continuous I.V. infusion is preferred)

I.V. infusion: Initial loading dose: 75 units/kg given over 10 minutes, then initial maintenance dose: 20 units/kg/hour; adjust dose to maintain aPTT of 60-85 seconds (assuming this reflects an antifactor Xa level of 0.35-0.7 units/mL); see table.

Pediatric Protocol For Systemic Heparin Adjustment

To be used after initial loading dose and maintenance I.V. infusion dose (see usual dosage listed above) to maintain aPTT of 60-85 seconds (assuming this reflects antifactor Xa level of 0.35-0.7 units/mL).

Obtain blood for aPTT 4 hours after heparin loading dose and 4 hours after every infusion rate change.

Obtain daily CBC and aPTT after aPTT is therapeutic.

aPTT (seconds)	**Dosage Adjustment**	**Time to Repeat aPTT**
<50	Give 50 units/kg bolus and increase infusion rate by 10%	4 h after rate change
50-59	Increase infusion rate by 10%	4 h after rate change
60-85	Keep rate the same	Next day
86-95	Decrease infusion rate by 10%	4 h after rate change
96-120	Hold infusion for 30 minutes and decrease infusion rate by 10%	4 h after rate change
>120	Hold infusion for 60 minutes and decrease infusion rate by 15%	4 h after rate change
Modified from Monagle P, Chalmers E, Chan A, et al, “Antithrombotic Therapy in Neonates and Children,” *Chest*, 2008, 133(6 Suppl):887-968.		

Note: Refer to adult dosing for notes on line flushing and TPN.

Calculations

- Heparin Maintenance Infusion

Administration: I.M.Do not administer I.M. due to pain, irritation, and hematoma formation.
Administration: I.V.

Continuous infusion: Infuse via infusion pump.

Heparin lock: Inject via injection cap using positive pressure flushing technique. Heparin lock flush solution is intended only to maintain patency of I.V. devices and is **not** to be used for anticoagulant therapy.

Administration: OtherSubQ: Inject in subcutaneous tissue only (not muscle tissue). Injection sites should be rotated (usually left and right portions of the abdomen, above iliac crest).
StorageHeparin solutions are colorless to slightly yellow. Minor color variations do not affect therapeutic efficacy. Heparin should be stored at controlled room temperature. Protect from freezing and temperatures >40°C.

Stability at room temperature and refrigeration:

Prepared bag: 24 hours.

Premixed bag: After seal is broken. 4 days.

Out of overwrap stability: 30 days.

Reconstitution

Standard concentration/diluent: 25,000 units/500 mL D_5W (premixed). If preparing solution, mix thoroughly prior to administration.

Minimum volume: 250 mL D_5W.

Compatibility

Stable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, $D_{25}W$, fat emulsion 10%, ${}^1/_2NS$, NS, Ringer's injection; **variable stability (consult detailed reference)** in D_5NS, D_5W, $D_{10}W$, LR, peritoneal dialysis solutions, TPN.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, atropine, aztreonam, bleomycin, calcium gluconate, cefazolin, cefotetan, ceftazidime, ceftriaxone, chlordiazepoxide, chlorpromazine, cimetidine, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, daptomycin, dexmedetomidine, dexamethasone sodium phosphate, digoxin, diphenhydramine, docetaxel, dopamine, doxapram, doxorubicin liposome, edrophonium, enalaprilat, epinephrine, ertapenem, erythromycin lactobionate, esmolol, estrogens (conjugated), ethacrynate, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, granisetron, hetastarch in lactated electrolyte injection, hydralazine, hydrocortisone sodium succinate, hydromorphone, insulin (regular), isoproterenol, kanamycin, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, menadiol sodium diphosphate, meperidine, meropenem, methotrexate, methoxamine, methyldopate, methylergonovine, metoclopramide, metronidazole, micafungin, midazolam, milrinone, minocycline, mitomycin, morphine, nafcillin, neostigmine, nitroglycerin, norepinephrine, ondansetron, oxacillin, oxytocin, paclitaxel, pancuronium, pemetrexed, penicillin G potassium, pentazocine, phytonadione, piperacillin, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine edisylate, propofol, propranolol, pyridostigmine, ranitidine, remifentanil, sargramostim, scopolamine, sodium bicarbonate, sodium nitroprusside, streptokinase, succinylcholine, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate potassium, tigecycline, tirofiban, trimethobenzamide, trimethaphan camsylate, vasopressin, vecuronium, vinblastine, vincristine, warfarin, zidovudine. **Incompatible:** Alteplase, amiodarone, amphotericin B cholesteryl sulfate complex, amsacrine, ciprofloxacin, clarithromycin, diazepam, doxycycline, ergotamine, filgrastim, gatifloxacin, gentamicin, haloperidol lactate, idarubicin, isosorbide dinitrate, levofloxacin, methotrimeprazine, nesiritide, phenytoin, tobramycin, triflupromazine. **Variable (consult detailed reference):** Aldesleukin, antithymocyte globulin (rabbit), cisatracurium, dacarbazine, diltiazem, dobutamine, doxorubicin HCl, droperidol, drotrecogin alfa, fentanyl, labetalol, methylprednisolone sodium succinate, nicardipine, promethazine, quinidine gluconate, TPN, vancomycin, vinorelbine.

Compatibility in syringe: Compatible: Aminophylline, amphotericin B, ampicillin, atropine, bleomycin, buprenorphine, caffeine citrate, cefazolin, cefotaxime, cefoxitin, chloramphenicol, cisplatin, clindamycin, clonazepam, clonidine, cyclophosphamide, diatrizoate meglumine 52%, diatrizoate sodium 8%, diatrizoate sodium 60%, diazoxide, digoxin, dobutamine, dopamine, epinephrine, etomidate, fentanyl, floxacillin, fluorouracil, fosfomycin, furosemide, iohexol, iopamidol, iothalamate meglumine 60%, ioxaglate meglumine 39.3%, ioxaglate sodium 19.6%, leucovorin calcium, lidocaine, lincomycin, methotrexate, metoclopramide, mitomycin, nafcillin, naloxone, neostigmine, nitroglycerin, norepinephrine, pancuronium, penicillin G, pentoxifylline, phenobarbital, piperacillin, ranitidine, sodium nitroprusside, succinylcholine, tramadol, trimethoprim/sulfamethoxazole, verapamil, vincristine. **Incompatible:** Amikacin, amiodarone, chlorpromazine, diazepam, doxorubicin hydrochloride, droperidol, erythromycin, erythromycin lactobionate, gentamicin, haloperidol lactate, hydromorphone, kanamycin, meperidine, methotrimeprazine, midazolam, pantoprazole, pentazocine, promethazine, streptomycin, tobramycin, triflupromazine, vancomycin, warfarin. **Variable (consult detailed reference):** Cimetidine, dimenhydrinate, morphine, vinblastine.

Compatibility when admixed: Compatible: Aminophylline, amphotericin B, amphotericin B with hydrocortisone sodium succinate, ascorbic acid injection, bleomycin, calcium gluconate, cefepime, chloramphenicol, clindamycin, colistimethate, dimenhydrinate, dopamine, enalaprilat, esmolol, floxacillin, fluconazole, flumazenil, furosemide, hydromorphone, isoproterenol, lidocaine, lincomycin, magnesium sulfate, meropenem, methyldopate, methylprednisolone sodium succinate, nafcillin, norepinephrine, octreotide, potassium chloride, promazine, ranitidine, sodium bicarbonate, teicoplanin, verapamil, vitamin B complex, vitamin B complex with C. **Incompatible:** Alteplase, amikacin, atracurium, ciprofloxacin, cytarabine, daunorubicin hydrochloride, erythromycin lactobionate, gentamicin, hyaluronidase, kanamycin, levorphanol, meperidine, morphine, polymyxin B sulfate, promethazine, streptomycin. **Variable (consult detailed reference):** Ampicillin, antithymocyte globulin (rabbit), dobutamine, hydrocortisone sodium succinate, mitomycin, penicillin G potassium, penicillin G sodium, vancomycin.

Contraindications

Hypersensitivity to heparin or any component of the formulation (unless a life-threatening situation necessitates use and use of an alternative anticoagulant is not possible); severe thrombocytopenia; uncontrolled active bleeding except when due to disseminated intravascular coagulation (DIC); suspected intracranial hemorrhage; not for I.M. use; not for use when appropriate blood coagulation tests cannot be obtained at appropriate intervals (applies to full-dose heparin only)

Allergy Considerations

- Heparin (Unfractionated) Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding; risk factors include subacute bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; continuous GI tube drainage; severe uncontrolled hypertension; history of hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmologic surgery or other invasive procedures including spinal tap or spinal anesthesia; concomitant treatment with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients (especially women) >60 years of age. Discontinue if bleeding occurs; severe hemorrhage or overdosage may require protamine.

- Heparin-induced thrombocytopenia (HIT): May cause thrombocytopenia; monitor platelet count closely. Patients who develop HIT may be at risk of developing a new thrombus (heparin-induced thrombocytopenia and thrombosis [HITT]). Discontinue therapy and consider alternatives if platelets are <100,000/mm^3 and/or thrombosis develops. HIT or HITT may be delayed and can occur up to several weeks after discontinuation of heparin.

- Heparin resistance: Dose requirements >35,000 units/24 hours to maintain a therapeutic aPTT may occur in patients with antithrombin deficiency, increased heparin clearance, elevations in heparin-binding proteins, elevations in factor VIII and/or fibrinogen; frequently encountered in patients with fever, thrombosis, thrombophlebitis, infections with thrombosing tendencies, MI, cancer, and in postsurgical patients; measurement of anticoagulant effects using antifactor Xa levels may be of benefit.

- Hyperkalemia: Monitor for hyperkalemia; can cause hyperkalemia by suppressing aldosterone production.

- Hypersensitivity reactions: May occur; only in life-threatening situations when use of an alternative anticoagulant is not possible should heparin be cautiously used in patients with a documented hypersensitivity reaction.

- Osteoporosis: May occur with prolonged use (>6 months) due to a reduction in bone mineral density.

Special populations:

- Elderly: Use with caution in patients >60 years of age, particularly women; they are also more sensitive to the dose and a higher incidence of bleeding has been reported in these patients. May require lower doses.

Dosage form specific issues:

- Benzyl alcohol: Some preparations contain benzyl alcohol as a preservative. In neonates, large amounts of benzyl alcohol (>100 mg/kg/day) have been associated with fatal toxicity (gasping syndrome). The use of preservative-free heparin is, therefore, recommended in neonates.

- Sulfites: Some preparations contain sulfite which may cause allergic reactions.

Other warnings/precautions:

- Fatal medications errors: Many concentrations of heparin are available ranging from 1 unit/mL to 20,000 units/mL. Clinicians **must** carefully examine each prefilled syringe or vial prior to use ensuring that the correct concentration is chosen; fatal hemorrhages have occurred related to heparin overdose especially in pediatric patients.

Geriatric ConsiderationsIn the clinical setting, age has not been shown to be a reliable predictor of a patient's anticoagulant response to heparin. However, it is common for the elderly to have a "standard" response for the first 24-48 hours after a loading dose (5000 units) and a maintenance infusion of 800-1000 units/hour. After this period, they then have an exaggerated response (ie, elevated PTT), requiring a lower infusion rate. Hence, monitor closely during this period of therapy. Elderly women are more likely to have bleeding complications and osteoporosis may be a problem when used >3 months or total daily dose exceeds 30,000 units.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Heparin does not cross the placenta.

LactationDoes not enter breast milk/compatible

Adverse ReactionsFrequency not defined.

Cardiovascular: Allergic vasospastic reaction (possibly related to thrombosis), chest pain, hemorrhagic shock, shock, thrombosis

Central nervous system: Chills, fever, headache

Dermatologic: Alopecia (delayed, transient), bruising (unexplained), cutaneous necrosis, dysesthesia pedis, erythematous plaques (case reports), eczema, urticaria, purpura,

Endocrine & metabolic: Adrenal hemorrhage, hyperkalemia (suppression of aldosterone synthesis), ovarian hemorrhage, rebound hyperlipidemia on discontinuation

Gastrointestinal: Constipation, hematemesis, nausea, tarry stools, vomiting

Genitourinary: Frequent or persistent erection

Hematologic: Bleeding from gums, epistaxis, hemorrhage, ovarian hemorrhage, retroperitoneal hemorrhage, thrombocytopenia (see note)

Hepatic: Liver enzymes increased

Local: Irritation, erythema, pain, hematoma, and ulceration have been rarely reported with deep SubQ injections; I.M. injection (not recommended) is associated with a high incidence of these effects

Neuromuscular & skeletal: Peripheral neuropathy, osteoporosis (chronic therapy effect)

Ocular: Conjunctivitis (allergic reaction), lacrimation

Renal: Hematuria

Respiratory: Asthma, bronchospasm (case reports), hemoptysis, pulmonary hemorrhage, rhinitis

Miscellaneous: Allergic reactions, anaphylactoid reactions, heparin resistance, hypersensitivity (including chills, fever, and urticaria)

Note: Thrombocytopenia has been reported to occur at an incidence between 0% and 30%. It is often of no clinical significance. However, immunologically mediated heparin-induced thrombocytopenia (HIT) has been estimated to occur in 1% to 2% of patients, and is marked by a progressive fall in platelet counts and, in some cases, thromboembolic complications (skin necrosis, pulmonary embolism, gangrene of the extremities, stroke or MI). For recommendations regarding platelet monitoring during heparin therapy, see Monitoring Parameters.

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Aspirin: May enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Corticorelin: Heparin may enhance the adverse/toxic effect of Corticorelin. Significant hypotension and bradycardia have been previously attributed to this combination. *Risk X: Avoid combination*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Heparin may enhance the adverse/toxic effect of Drotrecogin Alfa. This is of concern with therapeutic dosages of heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nitroglycerin: May diminish the anticoagulant effect of Heparin. Nitroglycerin may decrease the serum concentration of Heparin. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, red clover, horse chestnut, garlic, green tea, ginseng, ginkgo (all have additional antiplatelet activity).

Test InteractionsIncreased thyroxine (competitive protein binding methods); increased PT

Aprotinin significantly increases aPTT and celite Activated Clotting Time (ACT) which may not reflect the actual degree of anticoagulation by heparin. Kaolin-based ACTs are not affected by aprotinin to the same degree as celite ACTs. While institutional protocols may vary, a minimal celite ACT of 750 seconds or kaolin-ACT of 480 seconds is recommended in the presence of aprotinin. Consult the manufacturer's information on specific ACT test interpretation in the presence of aprotinin.

Monitoring ParametersHemoglobin, hematocrit, signs of bleeding; fecal occult blood test; aPTT (or antifactor Xa activity levels) or ACT depending upon indication

Platelet counts should be routinely monitored when the risk of HIT is >0.1% (eg, receiving therapeutic dose heparin, postoperative antithrombotic prophylaxis), if the patient has received heparin or low molecular weight heparin (eg, enoxaparin) within the past 100 days, if preexposure history is uncertain, or if anaphylactoid reaction to heparin occurs. When the risk of HIT is <0.1% (eg, medical/obstetrical patients receiving heparin flushes), routine platelet count monitoring is not recommended (Hirsh, 2008).

For intermittent I.V. injections, aPTT is measured 3.5-4 hours after I.V. injection.

For SubQ injections, when used for treatment (eg, monitored dosing regimen), aPTT is measured 6 hours after injection.

Note: Continuous I.V. infusion is preferred over I.V. intermittent injections. For full-dose heparin (ie, nonlow-dose), the dose should be titrated according to aPTT results. For anticoagulation, an aPTT 1.5-2.5 times normal is usually desired. Because of variation among hospitals in the control aPTT values, nomograms should be established at each institution, designed to achieve aPTT values in the target range (eg, for a control aPTT of 30 seconds, the target range [1.5-2.5 times control] would be 45-75 seconds). Measurements should be made prior to heparin therapy, 6 hours (pediatric: 4 hours) after initiation, and 6 hours (pediatric: 4 hours) after any dosage change, and should be used to adjust the heparin infusion until the aPTT exhibits a therapeutic level. When two consecutive aPTT values are therapeutic, subsequent measurements may be made every 24 hours, and if necessary, dose adjustment carried out. In addition, a significant change in the patient's clinical condition (eg, recurrent ischemia, bleeding, hypotension) should prompt an immediate aPTT determination, followed by dose adjustment if necessary. In general, may increase or decrease infusion by 2-4 units/kg/hour dependent upon aPTT.

Heparin infusion dose adjustment: A number of dose-adjustment nomograms have been developed which target an aPTT range of 1.5-2.5 times control (Cruickshank, 1991; Flaker, 1994; Hull, 1992; Raschke, 1993). However, institution-specific and indication-specific nomograms should be consulted for dose adjustment. **Note:** aPTT values vary throughout the day with maximum values occurring during the night (Decousus, 1985).

Reference RangeHeparin: 0.3-0.7 unit/mL (by anti-Xa chromogenic assay) or 0.2-0.4 unit/mL (by protamine titration); aPTT: 1.5-2.5 times **the patient's baseline**

Nursing: Physical Assessment/MonitoringAssess for risk factors for increased bleeding prior to starting therapy. Assess potential for interactions with other pharmacologic agents or herbal products patient may be taking (especially anything that will affect coagulation or platelet function). Note specific infusion directions in Administration. Bleeding precautions should be observed at all times during heparin therapy. Evaluate results of laboratory tests regularly for necessary dosing adjustments and therapeutic effectiveness. Assess therapeutic response and adverse response on a regular basis throughout therapy (eg, hypersensitivity reaction, bleeding, chest pain, hyperkalemia, peripheral neuropathy). For I.V. bolus administration, emergency treatment for hypersensitivity reactions should be immediately available. Teach patient possible side effects/appropriate interventions (eg, bleeding precautions) and adverse symptoms to report.

Monitoring: Lab TestsHemoglobin, hematocrit; fecal occult blood test; aPTT (or antifactor Xa activity levels) or ACT depending upon indication

Platelet counts should be routinely monitored when the risk of HIT is >0.1% (eg, receiving therapeutic dose heparin, postoperative antithrombotic prophylaxis), if the patient has received heparin or low molecular weight heparin (eg, enoxaparin) within the past 100 days, if preexposure history is uncertain, or if anaphylactoid reaction to heparin occurs. When the risk of HIT is <0.1% (eg, medical/obstetrical patients receiving heparin flushes), routine platelet count monitoring is not recommended (Hirsh, 2008).

For intermittent I.V. injections, aPTT is measured 3.5-4 hours after I.V. injection.

For SubQ injections, when used for treatment (eg, monitored dosing regimen), aPTT is measured 6 hours after injection.

Heparin infusion dose adjustment: A number of dose-adjustment nomograms have been developed which target an aPTT range of 1.5-2.5 times control (Cruickshank, 1991; Flaker, 1994; Hull, 1992; Raschke, 1993). However, institution-specific and indication-specific nomograms should be consulted for dose adjustment. **Note:** aPTT values vary throughout the day with maximum values occurring during the night (Decousus, 1985).

Patient EducationDo not take any new medication, including over-the-counter and biological products, during therapy unless approved by prescriber. This drug can only be administered by infusion or injection. You may have a tendency to bleed easily while taking this drug (brush teeth with soft brush, floss with waxed floss, use electric razor, avoid scissors or sharp knives, and potentially harmful activities). Report immediately any chest pain; difficulty breathing or unusual cough; bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool); pain in joints or back; CNS changes (fever, confusion); unusual fever; persistent nausea or GI upset; change in vision, or swelling, pain, or redness at injection site. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion, as sodium [premixed in NaCl 0.45%; porcine intestinal mucosa source]: 12,500 units (250 mL); 25,000 units (250 mL, 500 mL)

Infusion, as sodium [preservative free; premixed in D_5W; porcine intestinal mucosa source]: 10,000 units (100 mL) [contains sodium metabisulfite]; 12,500 units (250 mL) [contains sodium metabisulfite]; 20,000 units (500 mL) [contains sodium metabisulfite]; 25,000 units (250 mL, 500 mL) [contains sodium metabisulfite]

Infusion, as sodium [preservative free; premixed in NaCl 0.9%; porcine intestinal mucosa source]: 1000 units (500 mL); 2000 units (1000 mL)

Injection, solution, as sodium [lock flush preparation; porcine intestinal mucosa source; multidose vial]: 10 units/mL (1 mL, 10 mL, 30 mL) [contains parabens]; 100 units/mL (1 mL, 5 mL) [contains parabens]

Injection, solution, as sodium [lock flush preparation; porcine intestinal mucosa source; multidose vial]: 10 units/mL (10 mL, 30 mL); 100 units/mL (10 mL, 30 mL) [contains benzyl alcohol]

Hep-Lock®: 10 units/mL (1 mL, 2 mL, 10 mL, 30 mL); 100 units/mL (1 mL, 2 mL, 10 mL, 30 mL) [contains benzyl alcohol]

Injection, solution, as sodium [lock flush preparation; porcine intestinal mucosa source; prefilled syringe]: 10 units/mL (1 mL, 2 mL, 3 mL, 5 mL); 100 units/mL (1 mL, 2 mL, 3 mL, 5 mL) [contains benzyl alcohol]

Injection, solution, as sodium [preservative free; lock flush preparation; porcine intestinal mucosa source; prefilled syringe]: 1 unit/mL (2 mL, 3 mL, 5 mL); 2 units/mL (3 mL); 10 units/mL (2.5 mL, 3 mL, 5 mL, 10 mL); 100 units/mL (3 mL, 5 mL, 10 mL)

Injection, solution, as sodium [preservative free; lock flush preparation; porcine intestinal mucosa source; vial]:

HepFlush®-10: 10 units/mL (10 mL)

Hep-Lock U/P: 10 units/mL (1 mL); 100 units/mL (1 mL)

Injection, solution, as sodium [porcine intestinal mucosa source; multidose vial]: 1000 units/mL (1 mL, 10 mL, 30 mL) [contains benzyl alcohol]; 1000 units/mL (1 mL, 10 mL, 30 mL) [contains methylparabens]; 5000 units/mL (1 mL, 10 mL) [contains benzyl alcohol]; 5000 units/mL (1 mL) [contains methylparabens]; 10,000 units/mL (1 mL, 4 mL) [contains benzyl alcohol]; 10,000 units/mL (1 mL, 5 mL) [contains methylparabens]; 20,000 units/mL (1 mL) [contains methylparabens]

Injection, solution, as sodium [porcine intestinal mucosa source; prefilled syringe]: 5000 units/mL (1 mL) [contains benzyl alcohol]

Injection, solution, as sodium [preservative free; porcine intestinal mucosa source; prefilled syringe]: 10,000 units/mL (0.5 mL)

Injection, solution, as sodium [preservative free; porcine intestinal mucosa source; vial]: 1000 units/mL (2 mL); 2000 units/mL (5 mL); 2500 units/mL (10 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Heparin Sodium (Porcine))

1000 units/mL (10): $188.99

10000 units/mL (25): $259.20

10000 units/mL (125): $660.64

Mechanism of ActionPotentiates the action of antithrombin III and thereby inactivates thrombin (as well as activated coagulation factors IX, X, XI, XII, and plasmin) and prevents the conversion of fibrinogen to fibrin; heparin also stimulates release of lipoprotein lipase (lipoprotein lipase hydrolyzes triglycerides to glycerol and free fatty acids)

Pharmacodynamics/Kinetics

Onset of action: Anticoagulation: I.V.: Immediate; SubQ: ~20-30 minutes

Absorption: Oral, rectal: Erratic at best from these routes of administration; SubQ absorption is also erratic, but considered acceptable for prophylactic use

Distribution: Does not cross placenta; does not enter breast milk

Metabolism: Hepatic; may be partially metabolized in the reticuloendothelial system

Half-life elimination: Mean: 1.5 hours; Range: 1-2 hours; affected by obesity, renal function, hepatic function, malignancy, presence of pulmonary embolism, and infections

Excretion: Urine (small amounts as unchanged drug)

Cardiovascular Considerations

Heparin-Induced Thrombocytopenia: There are many misconceptions regarding the treatment of patient's with suspected or actual heparin-induced thrombocytopenia (HIT). It is well known that the diagnosis of HIT is based on clinical context and aided by serologic testing. In the right context, development of thrombocytopenia in patients receiving heparin therapy leads one to consider the diagnosis of HIT. A standardized patient evaluation should be adopted to optimally treat patients. Patients should be evaluated for heparin exposure and all forms of heparin discontinued. Next, initiation of an appropriate alternative form of anticoagulation is essential to prevent morbidity and mortality related to HIT. Finally, issues regarding long-term anticoagulation need to be considered.

The development of HIT can occur with the administration of either unfractionated or low molecular weight heparin and is not necessarily dependent on the dose administered. An evaluation for HIT should occur when the platelet count falls by ≥50% and/or a thrombotic event occurs between 5 and 14 days after heparin is initiated or received. Of note, patients who undergo cardiac surgery are at high risk of developing anti-PF4/heparin antibodies due to the amount of heparin exposure. HIT/HITT may even occur several weeks after heparin has been discontinued. It is important to recognize and evaluate patients for all sources of heparin they may be receiving. This includes subcutaneous heparin product administration, heparin flushes, heparin in admixtures such as parenteral nutrition, heparin use during dialysis, flushes for central and peripheral catheters, and implanted devices that may have heparin impregnated on the surface (heparin-coated pulmonary artery catheters). All forms of heparin must be discontinued and an appropriate alternate form of anticoagulation be initiated in patients with HIT regardless of documented thrombosis. Also, patients with suspected HIT or definite HIT should have this documented as an allergy in their medical record and signs indicating "No Heparin" should be placed above the patient's bed and documented in the pharmacy system.

Alternative anticoagulants such as direct thrombin inhibitors (argatroban, lepirudin, and bivalirudin) are the best approach in the United States (Greinacher, 1999; Greinacher, 1999; Greinacher, 2000). In Canada and other countries, one could also consider the initiation of full dose danaparoid. Alternative anticoagulation is necessary in order to treat and/or prevent new thromboembolic complications. During the subsequent days following the cessation of heparin in patients with isolated HIT, there is a high degree of thrombin generation increasing the likelihood of the development of thrombosis.

Low-molecular weight heparins should be avoided in the treatment of HIT because of the high degree of antibody cross reactivity (Warkentin, 1999). Also, in patients with isolated HIT or HIT with thrombosis (HITT), the use of vitamin K antagonists may lead to the development of venous limb gangrene when initiated as the treatment of HIT or if initiated without adequate anticoagulation from an appropriate alternative anticoagulant. Initiation of warfarin (maximum dose of 5 mg) or other vitamin K antagonists should be postponed until the platelet count has reached >150,000 x 10^9 cells/L. The patient should remain on the appropriate alternative anticoagulant, in the therapeutic range, while warfarin is being initiated. Since the effects of coumarin anticoagulants are delayed upon initiation, anticoagulation with an alternative anticoagulant should be continued for five days and the patient should have a therapeutic INR for at least two consecutive days before the alternative anticoagulant is discontinued (Hirsh, 2008).

Finally, there has been increasing interest in the use of specific factor Xa inhibitors, such as fondaparinux, for the treatment of HIT. Currently there is limited data for using fondaparinux for treating patients with HIT. Recent laboratory data suggests that fondaparinux is not reactive with HIT antibody positive serum (Savi, 2005). As more data becomes available, these agents may be suitable alternatives in the treatment of HIT.

ST-Elevation Myocardial Infarction (STEMI): In patients with STEMI, the use of I.V. unfractionated heparin (UFH) or LMWH should be used when patients are at high risk for systemic emboli (eg, large or anterior MI, atrial fibrillation, previous embolus, known LV thrombus, or cardiogenic shock) (Class I indication).

Unlike earlier nonspecific thrombolytics (eg, streptokinase, urokinase), fibrin-specific thrombolytics (eg, alteplase, reteplase, or tenecteplase) do not decrease levels of coagulation factors (eg, factors V and VIII) instead they increase thrombin generation which may propagate further thrombus formation. Therefore, the concomitant use of weight-adjusted unfractionated heparin or enoxaparin (if renal function is preserved) is recommended (Class I indication).

Unstable Angina/Non-ST-Elevation Myocardial Infarction (UA/NSTEMI): In patients with UA/NSTEMI, the 2007 ACC/AHA Guidelines recommend anticoagulation with subcutaneous LMWH or intravenous UFH be added to antiplatelet therapy with aspirin and/or clopidogrel as soon as possible after presentation in patients undergoing an invasive or a conservative strategy (Class I recommendation; level of evidence: A).

Clinical trials have indicated that UFH should be weight-adjusted which would provide a more predictable response. The ACC/AHA UA/STEMI and STEMI Guidelines recommend an initial dose of 60 units/kg and an initial infusion of 12 units/kg/hour with a goal to maintain activated partial thromboplastin time (aPTT) between 50-70 seconds (approximately 1.5-2 times control). Monitor aPTT at baseline and every 4-6 hours. Daily platelet counts may help in early identification of heparin-induced thrombocytopenia (HIT).

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Management of Intracerebral Hemorrhage (ICH) Due to Unfractionated Heparin (UFH): Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, UFH-related ICH should be treated with I.V. protamine given by slow I.V. injection (not to exceed 5 mg/minute) with a maximum dose of 50 mg (Class I recommendation). Faster infusions of protamine can result in cardiovascular collapse. The use of protamine for reversal of low molecular weight heparins (eg, enoxaparin) is significantly less effective.

Thrombocytopenia: Heparin-associated thrombocytopenia (HAT) commonly occurs within 48-72 hours of initiation. Platelet counts usually fall below 100,000 cells/mm^3 and return to normal within 4 days with continued heparin therapy. Heparin-induced thrombocytopenia (HIT) is a serious, immunoglobulin-mediated reaction with a high risk for thromboembolic events. In HIT, thrombocytopenia usually begins 5-10 days following heparin initiation; HIT can begin within ~10 hours in patients who have received heparin within the previous 100 days (Warkentin, 2001). It can also occur up to several weeks after heparin has been discontinued. Thrombocytopenia can be severe; heparin of all forms must be stopped including flushes and heparin-coated indwelling catheters.

Index TermsHeparin Calcium; Heparin Lock Flush; Heparin Sodium

English

Jump To Field (Select Field Name)

Pronunciation(hep a TYE tis aye & hep a TYE tis bee ree KOM be nant vak SEEN)

U.S. Brand NamesTwinrix®

Canadian Brand NamesTwinrix®

Pharmacologic CategoryVaccine, Inactivated (Viral)

Use: Labeled IndicationsActive immunization against disease caused by hepatitis A virus and hepatitis B virus (all known subtypes) in populations desiring protection against or at high risk of exposure to these viruses.

Populations include travelers to areas of intermediate/high endemicity for **both** HAV and HBV; those at increased risk of HBV infection due to behavioral or occupational factors; patients with chronic liver disease; laboratory workers who handle live HAV and HBV; healthcare workers, police, and other personnel who render first-aid or medical assistance; workers who come in contact with sewage; employees of day care centers and correctional facilities; patients/staff of hemodialysis units; male homosexuals; patients frequently receiving blood products; military personnel; users of injectable illicit drugs; close household contacts of patients with hepatitis A and hepatitis B infection; residents of drug and alcohol treatment centers

Dosing: AdultsPrimary immunization: I.M.: Three doses (1 mL each) given on a 0-, 1-, and 6-month schedule

Alternative regimen: Accelerated regimen: Four doses (1 mL each) on day 0, 7, and 21-30, followed by a booster at 12 months

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Shake well prior to use. Do not dilute prior to administration. Administer in the deltoid region; do not administer in the gluteal region (may give suboptimal response). Do not administer at the same site, or using the same syringe, as additional vaccines or immunoglobulins.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Hepatitis A and Hepatitis B vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Hepatitis A and Hepatitis B vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: Hepatitis A and Hepatitis B vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze (discard if frozen).

ContraindicationsHypersensitivity to hepatitis A vaccine; hepatitis B vaccine, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Cardiopulmonary disease: Use hepatitis B vaccine with caution in patients with decreased cardiopulmonary function.
- Hepatitis B infection: Unrecognized hepatitis B infection may be present; immunization may not prevent infection in these patients.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Elderly: Patients >65 years may have lower response rates to hepatitis B vaccine.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

- Yeast, neomycin, aluminum: Contains aluminum, yeast and trace amounts of neomycin.

Geriatric ConsiderationsNo adjustment for age is necessary. Some studies with HBV demonstrate a lower antibody titer in the elderly as compared to younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Healthcare providers are encouraged to call the manufacturer of Twinrix® to register any patients who may have received this vaccine during pregnancy (888-825-5249).

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Incidence of adverse effects of the combination product were similar to those occurring after administration of hepatitis A vaccine and hepatitis B vaccine alone. (Incidence reported is not versus placebo.)

>10%:

Central nervous system: Headache (13% to 22%), fatigue (11% to 14%)

Local: Injection site reaction: Soreness (37% to 41%), redness (8% to 11%)

1% to 10%:

Central nervous system: Fever (2% to 4%)

Gastrointestinal: Diarrhea (4% to 6%), nausea (2% to 4%), vomiting (≤1%)

Local: Injection site reaction: Swelling (4% to 6%), induration

Respiratory: Upper respiratory tract infection

<1%: Abdominal pain, agitation, anorexia, arthralgia, back pain, bruising at the injection site, diaphoresis, dizziness, erythema, flu-like syndrome, flushing, insomnia, irritability, migraine, myalgia, paresthesia, petechiae, pruritus at the injection site, rash, respiratory tract illness, somnolence, syncope, urticaria, vertigo, weakness

Postmarketing and/or case reports (as reported with hepatitis A vaccine and hepatitis B vaccine; also see individual agents): Allergic reactions, alopecia, anaphylactoid reactions, anaphylaxis, angioedema, arthritis, asthma-like symptoms, Bell's palsy, bronchospasm, conjunctivitis, convulsions, dyspepsia, dyspnea, earache, eczema, encephalopathy, erythema multiforme, erythema nodosum, Guillain-Barré syndrome, hepatitis, herpes zoster, hyperhidrosis, jaundice, liver function tests abnormal, MS, myelitis, neuropathy, optic neuritis, palpitations, paresis, serum-sickness like syndrome (days to weeks after vaccination), tachycardia, thrombocytopenia, tinnitus, transverse myelitis, visual disturbances

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, suspension [preservative free]:

Twinrix®: Hepatitis A virus antigen 720 ELISA units and hepatitis B surface antigen 20 mcg per mL (1 mL) [contains aluminum, yeast protein, and trace amounts of neomycin; prefilled syringe contains natural rubber/natural latex]

Generic AvailableNo

ManufacturerGlaxoSmithKline

Mechanism of Action

Hepatitis A vaccine, an inactivated virus vaccine, offers active immunization against hepatitis A virus infection at an effective immune response rate in up to 99% of subjects.

Recombinant hepatitis B vaccine is a noninfectious subunit viral vaccine. The vaccine is derived from hepatitis B surface antigen (HB_sAg) produced through recombinant DNA techniques from yeast cells. The portion of the hepatitis B gene which codes for HB_sAg is cloned into yeast which is then cultured to produce hepatitis B vaccine.

In immunocompetent people, Twinrix® provides active immunization against hepatitis A virus infection (at an effective immune response rate >99% of subjects) and against hepatitis B virus infection (at an effective immune response rate of 93% to 97%) 30 days after completion of the 3-dose series. This is comparable to using hepatitis A vaccine and hepatitis B vaccine concomitantly.

Pharmacodynamics/Kinetics

Onset of action: Seroconversion for antibodies against HAV and HBV were detected 1 month after completion of the 3-dose series.

Duration: Patients remained seropositive for at least 4 years during clinical studies.

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Flu-like syndrome and upper respiratory tract infection.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Fatigue is common

Mental Health: Effects on Psychiatric Treatment May cause GI side effects; concomitant use with SSRIs, lithium, and valproic acid may produce additive effects. May cause flu-like syndrome; differentiate from antidepressant withdrawal symptoms.

Jump To Field (Select Field Name)

Pronunciation(hep a TYE tis aye vak SEEN)
U.S. Brand NamesHAVRIX®; VAQTA®
Canadian Brand NamesAvaxim®; Avaxim®-Pediatric; HAVRIX®; VAQTA®
Pharmacologic CategoryVaccine, Inactivated (Viral)
Use: Labeled Indications

Active immunization against disease caused by hepatitis A virus (HAV)

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for:

- All children ≥12 months of age
- Travelers to countries with intermediate to high endemicity of HAV (a list of countries is available at http://wwwn.cdc.gov/travel/contentdiseases.aspx)
- Men who have sex with men
- Illegal drug users
- Patients with chronic liver disease
- Patients who receive clotting-factor concentrates
- Persons who work with HAV-infected primates or with HAV in a research laboratory setting

Dosing: AdultsImmunization: I.M.: **Note:** When used for primary immunization, the vaccine should be given at least 2 weeks prior to expected HAV exposure. When used for post-exposure prophylaxis, the vaccine should be given as soon as possible.

HAVRIX®: 1440 ELISA units (1 mL) with a booster dose of 1440 ELISA units to be given 6-12 months following primary immunization

VAQTA®: 50 units (1 mL) with 50 units (1 mL) booster dose of 50 units to be given 6-18 months after primary immunization (6-12 months if initial dose was with HAVRIX®)

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricImmunization: I.M.: **Note:** When used for primary immunization, the vaccine should be given at least 2 weeks prior to expected HAV exposure. When used for post-exposure prophylaxis, the vaccine should be given as soon as possible.

HAVRIX®: Children 12 months to 18 years: 720 ELISA units (0.5 mL) with a booster dose of 720 ELISA units to be given 6-12 months following primary immunization

VAQTA®: Children 12 months to 18 years: 25 units (0.5 mL) with 25 units (0.5 mL) booster to be given 6-18 months after primary immunization (6-12 months if initial dose was with HAVRIX®)

Administration: I.M.The deltoid muscle is the preferred site for injection; gluteal administration may decrease efficacy. Do not administer intravenously, intradermally, or subcutaneously. Shake well prior to use; discard if the suspension is discolored or does not appear homogenous after shaking. When used for primary immunization, the vaccine should be given at least 2 weeks prior to expected HAV exposure. When used for post-exposure prophylaxis, the vaccine should be given as soon as possible. For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Hepatitis A vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Hepatitis A vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: Hepatitis A vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore under refrigeration at 2˚C to 8˚C (36°F to 46˚F); do not freeze.
ContraindicationsHypersensitivity to hepatitis A vaccine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy have not been established in children <12 months of age

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

- Neomycin: Some products may contain neomycin.

Geriatric ConsiderationsThere is no specific data to suggest dosing is different than it is for younger adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. The safety of vaccination during pregnancy has not been determined, however, the theoretical risk to the infant is expected to be low.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS)) at 1-800-822-7967 or online at https://secure.vaers.org.**

Frequency dependent upon age, product used, and concomitant vaccine administration. In general, injection site reactions were less common in younger children.

>10%:

Central nervous system: Irritability (11% to 36%), drowsiness (15% to 17%), headache (≤1% to 16%), fever ≥100.4°F (9% to 11%)

Gastrointestinal: Anorexia (1% to 19%)

Local: Injection site: Pain, soreness, tenderness (3% to 56%), erythema (1% to 22%), warmth (<1% to 17%), swelling (1% to 14%)

1% to 10%:

Central nervous system: Fever ≥102°F (3%)

Dermatologic: Rash (≤1% to 5%)

Endocrine & metabolic: Menstrual disorder (1%)

Gastrointestinal: Diarrhea (<1% to 6%), vomiting (<1% to 4%), nausea (2%), abdominal pain (<1% to 2%)

Local: Injection site bruising (1% to 2%), induration

Neuromuscular & skeletal: Weakness/fatigue (4%), myalgia (<1% to 2%), arm pain (1%), back pain (1%), stiffness (1%)

Ocular: Conjunctivitis (1%)

Otic: Otitis media (8%), otitis (2%)

Respiratory: Upper respiratory tract infection (<1% to 10%), rhinorrhea (6%), cough (1% to 5%), pharyngitis (<1% to 3%), respiratory congestion (2%), nasal congestion (1%), laryngotracheobronchitis (1%)

Miscellaneous: Crying (2%), viral exanthema (1%)

<1%, postmarketing, and/or case reports: Allergic reaction, anaphylaxis, angioedema, arthralgia, asthma, bronchial constriction, bronchiolitis, cerebellar ataxia, CK increased, dehydration, dermatitis, diabetes mellitus, dizziness, dyspnea, encephalitis, erythema multiforme, eosinophilia, eye irritation, gastroenteritis, Guillain-Barré syndrome, hepatitis, hyperhidrosis, hypertonic episode, injection site hematoma, injection site itching, injection site rash, insomnia, jaundice, Kawasaki's disease, liver function tests increased, lymphadenopathy, multiple sclerosis, myelitis, neuropathy, paresthesia, photophobia, pneumonia, pruritus, seizure, somnolence, syncope, taste disturbance, thrombocytopenia, urine protein increased, urticaria, vertigo, wheezing

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring ParametersLiver function tests

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Mechanism of ActionAs an inactivated virus vaccine, hepatitis A vaccine offers active immunization against hepatitis A virus infection at an effective immune response rate in up to 99% of subjects

Pharmacodynamics/Kinetics

Onset of action (protection): 2-4 weeks after a single dose; 2 weeks after vaccine administration, 54% to 62% of patients develop neutralizing antibodies; this percentage increases to 94% to 100% at 1 month postvaccination (CDC, 2006)

Duration: Neutralizing antibodies have persisted for up to 8 years; based on kinetic models, antibodies may be present ≥14-20 years in children and ≥25 years in adults who receive the complete vaccination series (CDC, 2006; Van Damme, 2003).

Related Information

- Immunization Recommendations
- Prophylaxis for Patients Exposed to Common Communicable Diseases
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsThe ACIP currently recommends that older adults, the immunocompormised, or persons with underlying medical conditions (including chronic liver disease) that are vaccinated <2 weeks from departure to an area with a high risk of hepatitis A infection also receive immune globulin.

Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusIrritability and drowsiness are common; may cause weakness and fatigue

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

HBIG may be confused with BabyBIG

Pronunciation(hep a TYE tis bee i MYUN GLOB yoo lin YU man)

U.S. Brand NamesHepaGam B™; HyperHEP B™ S/D; Nabi-HB®

Canadian Brand NamesHepaGam B™; HyperHep B®

Pharmacologic CategoryImmune Globulin

Use: Labeled Indications

Passive prophylactic immunity to hepatitis B following: Acute exposure to blood containing hepatitis B surface antigen (HBsAg); perinatal exposure of infants born to HBsAg-positive mothers; sexual exposure to HBsAg-positive persons; household exposure to persons with acute HBV infection

Prevention of hepatitis B virus recurrence after liver transplantation in HBsAg-positive transplant patients

Note: Hepatitis B immune globulin is not indicated for treatment of active hepatitis B infection and is ineffective in the treatment of chronic active hepatitis B infection.

Dosing: Adults

Postexposure prophylaxis: I.M.: 0.06 mL/kg as soon as possible after exposure (ie, within 24 hours of needlestick, ocular, or mucosal exposure or within 14 days of sexual exposure); usual dose: 3-5 mL; repeat at 28-30 days after exposure in nonresponders to hepatitis B vaccine or in patients who refuse vaccination

Note: HBIG may be administered at the same time (but at a different site) or up to 1 month preceding hepatitis B vaccination without impairing the active immune response

Prevention of hepatitis B virus recurrence after liver transplantation (HepaGam B™): I.V.: 20,000 int. units/dose according to the following schedule:

Anhepatic phase (Initial dose): One dose given with the liver transplant

Week 1 postop: One dose daily for 7 days (days 1-7)

Weeks 2-12 postop: One dose every 2 weeks starting day 14

Month 4 onward: One dose monthly starting on month 4

Dose adjustment: Adjust dose to reach anti-HBs levels of 500 int. units/L within the first week after transplantation. In patients with surgical bleeding, abdominal fluid drainage >500 mL or those undergoing plasmapheresis, administer 10,000 int. units/dose every 6 hours until target anti-HBs levels are reached.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Perinatal exposure of infants born to HBsAg-positive mothers: Newborns: I.M.: 0.5 mL as soon after birth as possible (within 12 hours); active vaccination with hepatitis B vaccine may begin at the same time in a different site (if not contraindicated). If first dose of hepatitis B vaccine is delayed for as long as 3 months, dose may be repeated. If hepatitis B vaccine is refused, dose may be repeated at 3 and 6 months.

Household exposure prophylaxis in infants <12 months: I.M.: 0.5 mL (to be administered if mother or primary caregiver has acute HBV infection).

Postexposure prophylaxis: I.M.: Children ≥12 months: Refer to adult dosing.

Note: HBIG may be administered at the same time (but at a different site) or up to 1 month preceding hepatitis B vaccination without impairing the active immune response

Administration: I.M.Postexposure prophylaxis: I.M. injection only in anterolateral aspect of upper thigh and deltoid muscle of upper arm; to prevent injury from injection, care should be taken when giving to patients with thrombocytopenia or bleeding disorders

Administration: I.V.

HepaGam B™: Liver transplant: Administer at 2 mL/minute. Decrease infusion to ≤1 mL/minute for patient discomfort or infusion-related adverse events. Actual volume of infusion is dependant upon potency labeled on each individual vial.

Nabi-HB®: Although not an FDA-approved for this purpose, Nabi-HB® has been administered intravenously in hepatitis B-positive liver transplant patients

StorageRefrigerate at 2°C to 8°C (36°F to 46°F); do not freeze. Use within 6 hours of entering vial. Do not shake vial; avoid foaming.
ContraindicationsHypersensitivity to hepatitis B immune globulin or any component of the formulation; severe allergy to gamma globulin or anti-immunoglobulin therapies
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Use with caution in patients with isolated immunoglobulin A deficiency or a history of systemic hypersensitivity to human immunoglobulins.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with thrombocytopenia or coagulation disorders; I.M. injections may be contraindicated.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

- Maltose: Some products may contain maltose, which may result in falsely-elevated blood glucose readings.

Geriatric ConsiderationsNo data available to suggest different dosing in the elderly than in younger adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsInfants born to HBsAg-positive mothers may be breast fed.
Adverse ReactionsReported with postexposure prophylaxis; frequency not defined. Adverse events reported in liver transplant patients included tremor and hypotension, were associated with a single infusion during the first week of treatment, and did not recur with additional infusions.

Central nervous system: Fainting, headache, lightheadedness, malaise

Dermatologic: Angioedema, bruising, urticaria

Gastrointestinal: Nausea, vomiting

Hematologic: WBC decreased

Hepatic: Alkaline phosphatase increased, AST increased

Local: Ache, erythema, pain, and/or tenderness at injection site

Neuromuscular & skeletal: Arthralgia, joint stiffness, myalgia

Renal: Creatinine increased

Respiratory: Cold symptoms

Miscellaneous: Anaphylaxis, flu-like syndrome

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test Interactions

Glucose testing: HepaGam B™ contains maltose. Falsely-elevated blood glucose levels may occur when glucose monitoring devices and test strips utilizing the glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ) based methods are used.

Serological testing: Antibodies transferred following administration of immune globulins may provide misleading positive test results (eg, Coombs' test)

Monitoring ParametersLiver transplant: Serum HBsAg; infusion-related adverse events
Monitoring: Lab TestsLiver transplant: Serum HBsAg
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Potency expressed in international units (as compared to the WHO standard) is noted by individual lot on the vial label.

Injection, solution [preservative free]:

HyperHEP B™ S/D: Anti-HBs ≥220 int. units/mL (0.5 mL, 1 mL, 5 mL)

Nabi-HB®: Anti-HBs >312 int. units/mL (1 mL, 5 mL) [contains polysorbate 80]

HepaGam B™: Anti-HBs 312 int. units/mL (1 mL, 5 mL) [contains maltose and polysorbate 80]

Generic AvailableNo

Mechanism of ActionHepatitis B immune globulin (HBIG) is a nonpyrogenic sterile solution containing immunoglobulin G (IgG) specific to hepatitis B surface antigen (HB_sAg). HBIG differs from immune globulin in the amount of anti-HB_s. Immune globulin is prepared from plasma that is not preselected for anti-HB_s content. HBIG is prepared from plasma preselected for high titer anti-HB_s. In the U.S., HBIG has an anti-HB_s high titer >1:100,000 by IRA.

Pharmacodynamics/Kinetics

Duration: Postexposure prophylaxis: 3-6 months

Absorption: I.M.: Slow

Half-life: 17-25 days

Distribution: V_d: 7-15 L

Time to peak, serum: I.M.: 2-10 days

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsEach vial contains anti-HB_s antibody equivalent to or exceeding the potency of anti-HB_s in a U.S. reference standard hepatitis B immune globulin (FDA). The U.S. reference standard has been tested against the WHO standard hepatitis B immune globulin with listed values between 207 int. units/mL and 220 int. units/mL (included in individual product information).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentSedative effects may be additive with concurrent psychotropic use

Anesthesia and Critical Care Concerns/Other ConsiderationsHepatitis B immune globulin has been administered intravenously in hepatitis B-positive liver transplant patients.

Medication Safety Issues

Sound-alike/look-alike issues:

Recombivax HB® may be confused with Comvax®

Pronunciation(hep a TYE tis bee vak SEEN ree KOM be nant)

U.S. Brand NamesEngerix-B®; Recombivax HB®

Canadian Brand NamesEngerix-B®; Recombivax HB®

Pharmacologic CategoryVaccine, Inactivated (Viral)

Use: Labeled IndicationsImmunization against infection caused by all known subtypes of hepatitis B virus (HBV), in individuals seeking protection from HBV infection and/or in the following individuals considered at high risk of potential exposure to hepatitis B virus or HBsAg-positive materials:

Workplace Exposure:

- Healthcare workers[1] (including students, custodial staff, lab personnel, etc)
- Police and fire personnel
- Military personnel
- Morticians and embalmers
- Clients/staff of institutions for the developmentally disabled

Lifestyle Factors:

- Homosexual men
- Heterosexually-active persons with multiple partners in a 6-month period or those with recently acquired sexually-transmitted disease
- Intravenous drug users

Specific Patient Groups:

- Those on hemodialysis[2], receiving transfusions[3], or in hematology/oncology units
- Adolescents
- Infants born of HBsAG-positive mothers
- Individuals with chronic liver disease
- Individual with HIV infection

Others:

- Prison inmates and staff of correctional facilities
- Household and sexual contacts of HBV carriers
- Residents, immigrants, adoptees, and refugees from areas with endemic HBV infection (eg, Alaskan Eskimos, Pacific Islanders, Indochinese, and Haitian descent)
- International travelers to areas of endemic HBV
- Children born after 11/21/1991

[1] The risk of hepatitis B virus (HBV) infection for healthcare workers varies both between hospitals and within hospitals. Hepatitis B vaccination is recommended for all healthcare workers with blood exposure.

[2] Hemodialysis patients often respond poorly to hepatitis B vaccination; higher vaccine doses or increased number of doses are required. A special formulation of one vaccine is now available for such persons (Recombivax HB®, 40 mcg/mL). The anti-HB$_s$ (antibody to hepatitis B

surface antigen) response of such persons should be tested after they are vaccinated, and those who have not responded should be revaccinated with 1-3 additional doses. Patients with chronic renal disease should be vaccinated as early as possible, ideally before they require hemodialysis. In addition, their anti-HB^{s} levels should be monitored at 6- to 12-month intervals to assess the need for revaccination.

[3] Patients with hemophilia should be immunized subcutaneously, not intramuscularly.

In addition, the Advisory Committee on Immunization Practices (ACIP) recommends vaccination for any persons who are wounded in bombings or similar mass casualty events who have penetrating injuries or nonintact skin exposure, or who have contact with mucous membranes (exception - superficial contact with intact skin), and who cannot confirm receipt of a hepatitis B vaccination.

Dosing: Adults

Immunization regimen:

Note: Regimen consists of 3 doses (0, 1, and 6 months): First dose given on the elected date, second dose given 1 month later, third dose given 6 months after the first dose; see table.

When used for immediate prophylactic intervention (eg, administration to persons who are wounded in bombings or similar mass casualty events), vaccination should begin within 24 hours and no later than 7 days following the event

Routine Immunization Regimen of Three I.M. Hepatitis B Vaccine Doses

Age	Initial		1 mo		2 mo	6 mo[1]	
	Recombivax HB® (mL)	**Engerix-B® (mL)**	**Recombivax HB® (mL)**	**Engerix-B® (mL)**	**Engerix-B® (mL)**	**Recombivax HB® (mL)**	**Engerix-B® (mL)**
Birth[2] to 19 y	0.5[3]	0.5[4]	0.5[3]	0.5[4]	--	0.5[3]	0.5[4]
≥20 y[5]	1[6]	1[7]	1[6]	1[7]	--	1[6]	1[7]
Dialysis or immunocompromised patients[8]	1[9]	2[10]	1[9]	2[10]	2[10]	1[9]	2[10]
[1] Final dose in series should not be administered before age of 24 weeks.							
[2] Infants born of HBsAg **negative** mothers.							
[3] 5 mcg/0.5 mL pediatric/adolescent formulation.							
[4] 10 mcg/0.5 mL formulation.							
[5] Alternately, doses may be administered at 0, 1, and 4 months **or** at 0, 2, and 4 months.							
[6] 10 mcg/mL adult formulation.							
[7] 20 mcg/mL formulation.							
[8] Revaccinate if anti-HBs <10 mIU/mL ≥1-2 months after third dose.							
[9] 40 mcg/mL dialysis formulation.							
[10] Two 1 mL doses given at different sites using the 20 mcg/mL formulation.							

Alternative dosing schedule for ***Recombivax HB®:*** Adults ≥20 years: Doses may be administered at 0, 1, and 4 months **or** at 0, 2, and 4 months

Alternative dosing schedules for ***Engerix-B®:*** Adults ≥20 years:

Doses may be administered at 0, 1, and 4 months **or** at 0, 2, and 4 months

High-risk adults (20 mcg/mL formulation): 1 mL at 0, 1, 2, and 12 months. If booster dose is needed, revaccinate with 1 mL.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Immunization regimen: I.M.: Regimen consists of 3 doses (0, 1, and 6 months): First dose given on the elected date, second dose given 1 month later, third dose given 6 months after the first dose; see table.

Note: When used for immediate prophylactic intervention (eg, administration to persons who are wounded in bombings or similar mass casualty events), vaccination should begin within 24 hours and no later than 7 days following the event.

Alternative dosing schedule for Recombivax HB®: Children 11-15 years (10 mcg/mL adult formulation): First dose of 1 mL given on the elected date, second dose given 4-6 months later

Alternative dosing schedules for Engerix-B®:

Children ≤10 years (10 mcg/0.5 mL formulation): High-risk children: 0.5 mL at 0, 1, 2, and 12 months; lower-risk children ages 5-10 who are candidates for an extended administration schedule may receive an alternative regimen of 0.5 mL at 0, 12, and 24 months. If booster dose is needed, revaccinate with 0.5 mL.

Adolescents 11-19 years (20 mcg/mL formulation): 1 mL at 0, 1, and 6 months. High-risk adolescents: 1 mL at 0, 1, 2, and 12 months; lower-risk adolescents 11-16 years who are candidates for an extended administration schedule may receive an alternative regimen of 0.5 mL (using the 10 mcg/0.5 mL) formulation at 0, 12, and 24 months. If booster dose is needed, revaccinate with 20 mcg.

Postexposure prophylaxis: Note: High-risk individuals may include children born of hepatitis B-infected mothers, those who have been or might be exposed or those who have traveled to high-risk areas. See table.

Postexposure Prophylaxis Recommended Dosage for Infants Born to HBsAg-Positive Mothers

Treatment	**Birth ≤12 h**	**1 mo**	**6 mo**
Engerix-B® (pediatric formulation 10 mcg/0.5 mL)[1]	0.5 mL[2]	0.5 mL	0.5 mL
Recombivax HB® (pediatric/adolescent formulation 5 mcg/0.5 mL)	0.5 mL[2]	0.5 mL	0.5 mL
Hepatitis B immune globulin	0.5 mL[2]	—	—
[1] An alternate regimen is administration of the vaccine at birth, and 1, 2, and 12 months later.			
[2] The first dose of vaccine may be given at birth at the same time as HBIG, but give in the opposite anterolateral thigh. This may better ensure vaccine absorption. HBIG should be given immediately if mother is determined to be HBsAg-positive within 7 days of birth.			

Administration: I.M.It is possible to interchange the vaccines for completion of a series or for booster doses; the antibody produced in response to each type of vaccine is comparable, however, the quantity of the vaccine will vary

I.M. injection only; in adults, the deltoid muscle is the preferred site; the anterolateral thigh is the recommended site in infants and young children. Not for gluteal administration. Shake well prior to withdrawal and use.

For patients at risk of hemorrhage following intramuscular injection, hepatitis B vaccine may be administered subcutaneously although lower titers and/or increased incidence of local reactions may result. The ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Hepatitis B vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Hepatitis B vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: Hepatitis B vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

Vaccination at the time of HBsAg testing: For persons in whom vaccination is recommended, the first dose of hepatitis B vaccine can be given after blood is drawn to test for HBsAg.

StorageRefrigerate at 2°C to 8°C (36°F to 46°F); do not freeze.
ContraindicationsHypersensitivity to yeast, hepatitis B vaccine, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.

- Cardiopulmonary disease: Use with caution in patients with decreased cardiopulmonary function.

- Hepatitis B infection: Unrecognized hepatitis B infection may be present, immunization may not prevent infection in these patients.

- Multiple sclerosis: Use with caution in patients with multiple sclerosis; rare exacerbations of symptoms have been observed.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Elderly: Patients >65 years may have lower response rates.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

Geriatric ConsiderationsNo dose adjustments required based on age. Some studies demonstrate a lower antibody titer in the elderly as compared to young adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. The ACIP recommends HBsAg testing for all pregnant women. Based on limited data, there is no apparent risk to the fetus when the hepatitis B vaccine is administered during pregnancy. Pregnancy itself is not a contraindication to vaccination; vaccination should be considered if otherwise indicated.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsStudies suggest that infants born to HBsAg-positive mothers do not incur an increased risk of HBV infection through breast-feeding.
Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined. The most common adverse effects reported with both products included injection site reactions (>10%).

Cardiovascular: Flushing, hypotension

Central nervous system: Agitation, chills, dizziness, fatigue, fever (≥37.5°C / 100°F), headache, insomnia, irritability, lightheadedness, malaise, somnolence, vertigo

Dermatologic: Angioedema, petechiae, pruritus, rash, urticaria

Gastrointestinal: Abdominal pain, appetite decreased, constipation, cramps, diarrhea, dyspepsia, nausea, vomiting

Genitourinary: Dysuria

Local: Injection site reactions: Ecchymosis, erythema, induration, pain, nodule formation, soreness, swelling, tenderness, warmth

Neuromuscular & skeletal: Achiness, arthralgia, back pain, myalgia, neck pain, neck stiffness, paresthesia, shoulder pain, tingling, weakness

Otic: Earache

Respiratory: Cough, pharyngitis, rhinitis, upper respiratory tract infection

Miscellaneous: Diaphoresis, lymphadenopathy, flu-like syndrome

Postmarketing and/or case reports: Alopecia, anaphylaxis, arthritis, Bell's palsy, bronchospasm, conjunctivitis, eczema, encephalitis, erythema nodosum, erythema multiforme, erythrocyte sedimentation rate increased, febrile seizure, Guillain-Barré syndrome, herpes zoster, hypoesthesia, keratitis, liver enzymes increased, lupus-like syndrome, migraine, multiple sclerosis, muscle weakness, neuropathy, optic neuritis, palpitation, paresis, paresthesia, polyarteritis nodosa, purpura, seizure, serum-sickness like syndrome (may be delayed days to weeks), Stevens-Johnson syndrome, SLE, syncope, tachycardia, thrombocytopenia, tinnitus, transverse myelitis, vasculitis, visual disturbances, vertigo

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [adult; preservative free]:

Engerix-B®: Hepatitis B surface antigen 20 mcg/mL (1 mL) [contains aluminum, trace amounts of thimerosal; prefilled syringes contain natural rubber/natural latex]

Recombivax HB®: Hepatitis B surface antigen 10 mcg/mL (1 mL, 3 mL) [contains aluminum and yeast protein]

Injection, suspension [pediatric/adolescent; preservative free]:

Engerix-B®: Hepatitis B surface antigen 10 mcg/0.5 mL (0.5 mL) [contains aluminum, trace amounts of thimerosal; prefilled syringes contain natural rubber/natural latex]

Recombivax HB®: Hepatitis B surface antigen 5 mcg/0.5 mL (0.5 mL) [contains aluminum and yeast protein]

Injection, suspension [dialysis formulation; preservative free]:

Recombivax HB®: Hepatitis B surface antigen 40 mcg/mL (1 mL) [contains aluminum and yeast protein]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Recombivax HB)

10 mcg/mL (1): $73.99

Mechanism of ActionRecombinant hepatitis B vaccine is a noninfectious subunit viral vaccine, which confers active immunity via formation of antihepatitis B antibodies. The vaccine is derived from hepatitis B surface antigen (HBsAg) produced through recombinant DNA techniques from yeast cells. The portion of the hepatitis B gene which codes for HBsAg is cloned into yeast which is then cultured to produce hepatitis B vaccine.

Pharmacodynamics/KineticsDuration: Following a 3-dose series in children, up to 50% of patients will have low or undetectable anti-HB antibody 5-15 years postvaccination. However, anamnestic increases in anti-HB have been shown up to 23 years later suggesting a lifelong immune memory response.

Medication Safety Issues

Sound-alike/look-alike issues:

Hespan® may be confused with heparin

Pronunciation(HET a starch)

U.S. Brand NamesHespan®; Hextend®; Voluven®

Canadian Brand NamesHextend®; Voluven®

Pharmacologic CategoryPlasma Volume Expander, Colloid

Use: Labeled IndicationsBlood volume expander used in treatment of hypovolemia; prevention of hypovolemia (Voluven®); adjunct in leukapheresis to improve harvesting and increase the yield of granulocytes by centrifugation (Hespan®)

Use: Unlabeled/InvestigationalHextend®: Priming fluid in pump oxygenators during cardiopulmonary bypass; plasma volume expansion during cardiopulmonary bypass

Dosing: Adults

Volume expansion: 500-1000 mL (up to 1500 mL/day) or 20 mL/kg/day (up to 1500 mL/day); larger volumes (15,000 mL/24 hours) have been used safely in small numbers of patients

Voluven®: Up to 50 mL/kg/day

Leukapheresis (Hextend®): 250-700 mL; **Note:** Citrate anticoagulant is added before use.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPlasma volume expansion: I.V. infusion (requires an infusion pump):

Children <2 years: Voluven®: Average dose: 7-25 mL/kg; titrate to individual colloid needs, hemodynamic and hydration status

Children 2-12 years: Not studied

Children >12 years: Voluven®: Up to 50 mL/kg/day

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Initial dose is the same but subsequent doses should be reduced by 20% to 50% of normal.

Administration: I.V.Administer I.V. only; infusion pump is required. May administer up to 1.2 g/kg/hour (20 mL/kg/hour). Change I.V. tubing or flush copiously with normal saline before administering blood through the same line. Change I.V. tubing at least every 24 hours. Do not administer Hextend® with blood through the same administration set. Anaphylactoid reactions can occur, have epinephrine and resuscitative equipment available.

Administration: I.V. DetailDo not use if crystalline precipitate forms or is turbid deep brown.

pH: 3.5-7

Administration: OtherLeukapheresis: Mix Hespan® and citrate well. Administer to the input line of the centrifuge apparatus at a ration of 1:8 to 1:13 to venous whole blood.

StorageStore at room temperature; do not freeze. Do not use if crystalline precipitate forms or is turbid deep brown. In leukapheresis, admixtures of 500-560 mL of Hespan® with citrate concentrations up to 2.5% are compatible for 24 hours.

CompatibilityStable in NS.

Hespan®:

Y-site administration: Compatible: Cimetidine, diltiazem, doxycycline, enalaprilat, ertapenem, nicardipine. **Incompatible:** Amikacin, cefamandole, cefoperazone, cefotaxime, cefoxitin, gentamicin, ranitidine, theophylline, tobramycin. **Variable (consult detailed reference):** Ampicillin, cefazolin.

Compatibility when admixed: Compatible: Fosphenytoin, citrate.

Hextend®:

Y-site administration: Compatible: Alfentanil, amikacin, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, atracurium, azithromycin, aztreonam, bumetanide, butorphanol, calcium gluconate, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, clindamycin, dexamethasone, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, hydroxyzine, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, lorazepam, magnesium, mannitol, meperidine, methylprednisolone, metoclopramide, metronidazole, midazolam, milrinone, mivacurium, morphine, nalbuphine, nitroglycerin, norepinephrine, ofloxacin, ondansetron, pancuronium, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, ranitidine, rocuronium, sodium nitroprusside, succinylcholine, sufentanil, theophylline, thiopental, ticarcillin, ticarcillin-clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium, verapamil. **Incompatible:** Amphotericin B, diazepam, sodium bicarbonate.

ContraindicationsHypersensitivity to hydroxyethyl starch or any component of the formulation; renal failure with oliguria or anuria (not related to hypovolemia); any fluid overload condition (eg, pulmonary edema, congestive heart failure)

Hespan ® is also contraindicated in patients with pre-existing coagulation or bleeding disorders

Hextend® is also contraindicated with bleeding disorders; in the treatment of lactic acidosis and in leukapheresis

Voluven® is also contraindicated in patients receiving dialysis; severe hypernatremia; severe hyperchloremia; patients with intracranial bleeding

Allergy Considerations

- Hetastarch Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Have occurred; use caution in patients allergic to corn (may have cross allergy to hetastarch).
- Decreased hemoglobin: Large volume may cause drops in hemoglobin concentrations.
- Impaired platelet function: Volumes >1500 mL may interfere with platelet function and prolong PT and PTT times.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment; may result in further reduction of coagulation factors, increasing the risk of bleeding.
- Patients at risk for fluid overload: Use with caution in patients at risk from overexpansion of blood volume, including the very young or aged patients, those with HF.
- Renal impairment: The risk of adverse reactions may be increased in patients with renal impairment; monitor fluid status, urine output, and infusion rate. Larger hetastarch molecules may leak into urine in patients with glomerular damage; may elevate urine specific gravity.
- Thrombocytopenia: Use with caution in patients with thrombocytopenia; may interfere with platelet function.

Dosage form specific issues:

- Hextend®: Contains calcium, lactate and potassium; use with caution in situations where electrolyte and/or acid-base disturbances may be exacerbated (renal impairment, respiratory alkalosis).

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, circulatory overload, heart failure, peripheral edema, tachycardia

Central nervous system: Chills, fever, headache, intracranial bleeding

Dermatologic: Itching, pruritus (dose dependant; may be delayed), rash

Endocrine & metabolic: Metabolic acidosis, parotid gland enlargement

Gastrointestinal: Amylase levels increased, vomiting

Hematologic: Anemia, bleeding, bleeding time prolonged, clotting time prolonged, dilutional coagulopathy, disseminated intravascular coagulopathy (rare), factor VIII:C plasma levels decreased, hemolysis (rare), plasma aggregation decreased, PT prolonged, PTT prolonged, thrombocytopenia, von Willebrand factor decreased, wound hemorrhage

Hepatic: Bilirubin increased (indirect)

Neuromuscular & skeletal: Myalgia

Respiratory: Bronchospasm, pulmonary edema (noncardiac)

Miscellaneous: Anaphylactoid reactions, flu-like syndrome (mild), hypersensitivity

Postmarketing and/or case reports: Hypotension, urticaria

Drug InteractionsThere are no known significant interactions.
Test Interactions

Serum amylase levels may be temporarily elevated following administration; could interfere with the diagnosis of pancreatitis.

Large hetastarch volumes may result in decreased coagulation factors, plasma proteins, and /or hematocrit due to dilutional effect.

Monitoring ParametersVolume expansion: Blood pressure, heart rate, capillary refill time, CVP, RAP, MAP, urine output; if pulmonary artery catheter in place, monitor PCWP, SVR, and PVR; hemoglobin, hematocrit, serum electrolytes, renal function, acid-base balance, coagulation parameters, cardiac index

Leukapheresis: CBC, total leukocyte and platelet counts, leukocyte differential count, hemoglobin, hematocrit, PT, PTT

Nursing: Physical Assessment/MonitoringAssess patient's allergy history prior to therapy (patients allergic to corn may have a cross allergy to hetastarch). Evaluate appropriateness for treatment (eg, contraindicated with coagulation or bleeding disorder, intracranial bleeding, dialysis, renal failure, severe hepatic disease, fluid overload condition). Note specific directions for compatibility and administration. Patient must be monitored closely for hypersensitivity (anaphylactic reaction) and other major adverse reactions (eg, circulatory overload, cranial bleed, pulmonary edema). Vital signs, CVP, and urine output should be monitored frequently (every 5-15 minutes) during first hour and at regular intervals thereafter. Evaluate results of laboratory test during and after treatment. Patient teaching should be appropriate to patient condition.

Monitoring: Lab TestsVolume expansion: Hemoglobin, hematocrit, serum electrolytes, renal function, acid-base balance, coagulation parameters

Leukapheresis: CBC, total leukocyte and platelet counts, leukocyte differential count, hemoglobin, hematocrit, PT, PTT

Patient EducationReport immediately any chest pain or palpitations, respiratory difficulty, acute headache, muscle pain, abdominal cramping, chills, itching, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in lactated electrolyte injection]:

Hextend®: 6% (500 mL)

Infusion, solution [premixed in NaCl 0.9%]: 6% (500 mL)

Hespan®, Voluven®: 6% (500 mL)

Generic AvailableYes: Sodium chloride infusion

Mechanism of ActionProduces plasma volume expansion by virtue of its highly colloidal starch structure, similar to albumin

Pharmacodynamics/Kinetics

Onset of action: Volume expansion: I.V.: ~30 minutes

Duration: 6-36 hours

Distribution: Voluven®: 5.9 L

Metabolism: Molecules >50,000 daltons require enzymatic degradation by the reticuloendothelial system or amylases in the blood

Half-life elimination: Voluven®: 12 hours

Excretion: Urine (33% to 40% within 24 hours; ~62% within 72 hours); smaller molecular weight molecules readily excreted

Pharmacotherapy PearlsHetastarch is a synthetic polymer derived from a waxy starch composed of amylopectin.

Hespan®: 6% hetastarch in 0.9% sodium chloride

Molecular weight: 600,000

Sodium: 154 mEq/L

Chloride: 154 mEq/L

Osmolarity: ~309 mOsm/L

Hextend®: 6% hetastarch in lactated electrolyte injection

Molecular weight: ~670,000

Sodium: 143 mEq/L

Chloride: 124 mEq/L

Calcium: 5 mEq/L

Potassium: 3 mEq/L

Magnesium: 0.9 mEq/L

Lactate: 28 mEq/L

Dextrose: 0.99 g/L

Osmolarity: ~307 mOsm/L

Voluven®: 6% hetastarch (130/0.4) in 0.9% sodium chloride

Molecular weight: ~130,000

Sodium: 154 mEq/L

Chloride: 154 mEq/L

Osmolarity: 308 mOsm/L

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Hetastarch is a synthetic polymer derived from a waxy starch composed of amylopectin.

Hespan®: 6% hetastarch in 0.9% sodium chloride

Molecular weight: 600,000

Sodium: 154 mEq/L

Chloride: 154 mEq/L

Osmolarity: ~309 mOsm/L

Hextend®: 6% hetastarch in lactated electrolyte injection

Molecular weight: ~670,000

Sodium: 143 mEq/L

Chloride: 124 mEq/L

Calcium: 5 mEq/L

Potassium: 3 mEq/L

Magnesium: 0.9 mEq/L

Lactate: 28 mEq/L

Dextrose: 0.99 g/L

Osmolarity: ~307 mOsm/L

Voluven®: 6% hetastarch (130/0.4) in 0.9% sodium chloride

Molecular weight: ~130,000

Sodium: 154 mEq/L

Chloride: 154 mEq/L

Osmolarity: 308 mOsm/L

Hextend®, Hespan®, and Voluven® will expand the intravascular volume the same as an equal volume of 5% albumin. Hetastarch will increase the intravascular volume up to 6-36 hours depending on the formulation. Hetastarch does not have oxygen-carrying capacity and is not a substitute for blood or plasma. Large volumes of Hespan®, Hextend®, or Voluven® may interfere with platelet function, prolong PT and PTT times, and cause hemodilution; however, clinically Hextend® has not been associated with coagulation abnormalities in doses >20 mL/kg up to a total of 5000 mL. Voluven®, because of its low molecular weight and reduced molar substitution, also has a low potential for affecting coagulation.

Hextend®: Formulated with near physiologic levels of sodium, chloride, calcium, potassium, magnesium; may be associated with less electrolyte abnormalities than Hespan®; not to be used for the treatment of lactic acidosis; should not be administered through the same line as blood products; use with caution in patients with heart failure.

Hespan®: Intraoperative use in patients undergoing cardiac surgery with cardiopulmonary bypass may increase bleeding; each 500 mL provides 77 mEq sodium chloride and may cause hyperchloremic metabolic acidosis in large volumes; critically-ill patients receiving hetastarch infusions (goal: PCWP 12-18 mm Hg) had an increase in cardiac index, oxygen delivery, and consumption.

Voluven®: Up to 50 mL/kg/day (or 3500 mL/day in a 70 kg patient) may be used without significant effects on coagulation parameters. Eliminated more rapidly resulting in a shorter duration of action (4-6 hours) compared to other HES products. Because of minimal accumulation, tissue storage is reduced and may result in a lower rate of delayed-onset pruritus seen with other HES products.

Hextend®, Hespan®, and Voluven®: May increase serum amylase temporarily without an association with pancreatitis; not eliminated by hemodialysis.

Index TermsHES; Hydroxyethyl Starch

Medication Safety Issues

Sound-alike/look-alike issues:

pHisoHex® may be confused with Fostex®, pHisoDerm®

Pronunciation(heks a KLOR oh feen)
U.S. Brand NamespHisoHex®
Canadian Brand NamespHisoHex®
Pharmacologic CategoryAntibiotic, Topical
Use: Labeled IndicationsSurgical scrub and as a bacteriostatic skin cleanser; control an outbreak of gram-positive infection when other procedures have been unsuccessful
Dosing: AdultsAntiseptic (Children and Adults): Topical: Apply 5 mL cleanser and water to area to be cleansed; lather and rinse thoroughly under running water
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
StorageStore in nonmetallic container. Prolonged direct exposure to strong light may cause brownish surface discoloration, but this does not affect its action.
Compatibility**Incompatible** with many metals.
ContraindicationsHypersensitivity to halogenated phenol derivatives or hexachlorophene; use in premature infants; use on burned or denuded skin; occlusive dressing; application to mucous membranes
Warnings/Precautions

Concerns related to adverse effects:

- Cerebral irritability: Discontinue use if signs of cerebral irritability occur.

Special populations:

- Burn patients: Exposure to patients with extensive burns has been associated with apnea, convulsions, agitation and coma.
- Pediatrics: Exposure to preterm infants has been associated with apnea, convulsions, agitation and coma; particularly susceptible to hexachlorophene topical absorption. Do not use for bathing infants.

Other warnings/precautions:

- Appropriate use: For external use only; avoid exposure to eyes.

Pregnancy Risk FactorC
Adverse Reactions<1%: CNS injury, seizure, irritability, photosensitivity, dermatitis, redness, dry skin
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, topical: 3% (150 mL, 500 mL, 3840 mL)

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Liquid (Phisohex)

3% (148): $32.55

3% (473): $54.25

Mechanism of ActionBacteriostatic polychlorinated biphenyl which inhibits membrane-bound enzymes and disrupts the cell membrane
Pharmacodynamics/Kinetics

Absorption: Percutaneously through inflamed, excoriated, and intact skin

Distribution: Crosses placenta

Half-life elimination: Infants: 6.1-44.2 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Pronunciation(heks il re ZOR si nole)
U.S. Brand NamesS.T. 37® [OTC]; Sucrets® Original [OTC]
Pharmacologic CategoryAntiseptic, Topical; Local Anesthetic
Use: Labeled IndicationsMinor antiseptic and local anesthetic for sore throat; topical antiseptic for minor cuts or abrasions
Dosing: Adults

Antiseptic: Topical: Solution: Apply to affected area 1-3 times/day

Sore throat: Oral:

Lozenge: May be used as needed, allow to dissolve slowly in mouth (maximum: 10 lozenges/day)

Solution: Gargle or swish in mouth up to 4 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Antiseptic: Topical: Children ≥2 years: Refer to adult dosing.

Sore throat: Oral: Children ≥2 years: Refer to adult dosing.

ContraindicationsHypersensitivity to hexylresorcinol or any component of the formulation
Warnings/Precautions

Dosage form specific issues:

- Sore throat (self-medication, OTC use): When self-medicating, patients should be instructed to contact healthcare provider if the medication is used for sore throat lasting >7 days; if accompanied by fever, rash, nausea, or vomiting; or if symptoms worsen

- Topical antiseptic: Not for use over large areas of body, around eyes, deep or puncture wounds, animal bites, or serious burns. When used for self-medication (OTC use), not for use for >7 days. Contains sodium bisulfite which may cause allergic reactions in some individuals.

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Lozenge (Sucrets® Original): 2.4 mg [mint flavor]

Solution (S.T. 37®): 0.1% (480 mL) [contains sodium bisulfite]

Histrelin

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(his TREL in)

U.S. Brand NamesSupprelin® LA; Vantas™

Canadian Brand NamesVantas™

Pharmacologic CategoryGonadotropin Releasing Hormone Agonist

Use: Labeled IndicationsPalliative treatment of advanced prostate cancer; treatment of children with central precocious puberty (CPP)

Dosing: AdultsPalliative treatment of advanced prostate cancer: SubQ (Vantas™): 50 mg implant surgically inserted every 12 months

Dosing: ElderlySee adult dosing.

Dosing: PediatricCPP: SubQ (Supprelin® LA): Children ≥2 years: 50 mg implant surgically inserted every 12 months. Discontinue at the appropriate time for the onset of puberty.

Dosing: Renal ImpairmentCl_{cr}: 15-60 mL/minute: Adjustment not needed.

Administration: OtherSubQ: Surgical implantation into the inner portion of the upper arm requires the use of the implantation device provided. Use the patient's nondominant arm for placement. Removal must occur after 12 months; a replacement implant may be required. Palpate area of incision to locate implant for removal. If not readily palpated, ultrasound, CT or MRI may be used to locate implant; plain films are not recommended because the implant is not radiopaque.

StorageSupprelin® LA, Vantas™: Upon delivery, separate contents of implant carton. Store implant under refrigeration at 2°C to 8°C (36°F to 46°F), wrapped in the amber pouch for protection from light. Do not freeze. The implantation kit does not require refrigeration.

ContraindicationsHypersensitivity to histrelin acetate, GnRH, GnRH-agonist analogs, or any component of the formulation; pregnancy

Allergy Considerations

- GnRH Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hormonal effects: Transient increases in estradiol serum levels (female) or testosterone levels (female and male) may occur during the first week of use for CPP. Transient increases in testosterone serum levels occur during the first week of use for prostate cancer (initial flare).
- Pituitary apoplexy: Rare cases of pituitary apoplexy (frequently secondary to pituitary adenoma) have been observed with leuprolide administration (onset from 1 hour to usually <2 weeks); may present as sudden headache, vomiting, visual or mental status changes, and infrequently cardiovascular collapse; immediate medical attention required.
- Spinal cord compression: Has been reported, may contribute to paralysis when used for prostate cancer; closely observe patients with metastatic vertebral lesions for weakness and paresthesias in first few weeks of therapy.
- Urinary tract obstruction: Ureteral obstruction, may contribute to paralysis when used for prostate cancer; closely observe patients for urinary tract obstruction or poor urine output in first few weeks of therapy.
- Worsening of symptoms: May occur when using for CPP, however, manifestations of puberty should decrease within 4 weeks. Worsening symptoms such as bone pain, hematuria, neuropathy, ureteral or bladder outlet obstruction, and spinal cord compression have been reported when using for prostate cancer.

Disease-related concerns:

- Hepatic impairment: Safety and efficacy have not been established in prostate cancer patients with hepatic dysfunction.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age when using for CPP.

Pregnancy Risk FactorX

Pregnancy ConsiderationsFetal harm and an increase in fetal mortalities have been noted in animal studies. Histrelin is contraindicated for use during pregnancy or in women who may become pregnant.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding Considerations

Products are not indicated for use in postpubertal women.

Adverse Reactions

CPP:

>10%: Local: Insertion site reaction (51%; includes bruising, discomfort, itching, pain, protrusion of implant area, soreness, swelling, tingling)

>2% to 10%:

Endocrine & metabolic: Metrorrhagia (4%)

Local: Keloid scar (6%), scar (6%), suture-related complication (6%), pain at the application site (4%), post procedural pain (4%)

≤2%: Amblyopia, breast tenderness, cold feeling, disease progression, dysmenorrhea, epistaxis, erythema, flu-like syndrome, gynecomastia, headache, infection at the implant site, menorrhagia, migraine, mood swings, pituitary adenoma, pruritus, weight increase

Prostate cancer:

>10%:

Endocrine & metabolic: Hot flashes (66%)

Local: Implant site reaction (6% to 14%; includes bruising, erythema, pain, soreness, swelling, tenderness)

2% to 10%:

Central nervous system: Fatigue (10%), headache (3%), insomnia (3%)

Endocrine & metabolic: Gynecomastia (4%), sexual dysfunction (4%), libido decreased (2%)

Gastrointestinal: Constipation (4%), weight gain (2%)

Genitourinary: Expected pharmacological consequence of testosterone suppression: Testicular atrophy (5%)

Renal: Renal impairment (5%)

<2%: Abdominal discomfort, alopecia, anemia, appetite increased, arthralgia, AST increased, back pain, bone density decreased, bone pain, breast pain, breast tenderness, cold feeling, contusion, craving food, creatinine increased, depression, diaphoresis, dizziness, dyspnea (exertional), dysuria, fluid retention, flushing, genital pruritus, hematoma, hematuria, hypercalcemia, hypercholesterolemia, hyperglycemia, irritability, LDH increased, lethargy, limb pain, liver disorder, malaise, muscle twitching, myalgia, nausea, neck pain, night sweats, palpitation, peripheral edema, prostatic acid phosphatase increased, pruritus, renal calculi, renal failure, stent occlusion, testosterone increased, tremor, urinary frequency, urinary retention, ventricular asystoles, weakness, weight loss

Drug Interactions

Antidiabetic Agents: Luteinizing Hormone-Releasing Hormone Analogs may diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Test InteractionsResults of diagnostic test of pituitary gonadotropic and gonadal functions may be affected during and after therapy

Monitoring Parameters

CPP: LH, FSH, estradiol or testosterone (after 1 month then every 6 months); height, bone age (every 6-12 months); tanner staging

Prostate cancer: LH and FSH levels, serum testosterone levels, prostate specific antigen (PSA), bone mineral density; weakness, paresthesias, and urinary tract obstruction (especially during first few weeks of therapy)

Reference RangeProstate cancer:

Testosterone level: Expected to rise during the first few days and decline to below initiation level by week 2 before reaching ≤50 ng/dL (castrate level)

PSA: Expected to decrease to normal levels after 6 months of therapy

Note: Lack of response (testosterone and PSA decreases) should prompt suspicion that the implant has been expelled.

Nursing: Physical Assessment/MonitoringEvaluate results of laboratory tests after insertion and then periodically thereafter. Teach patient proper care of insertion site, possible side effects/appropriate interventions, and adverse symptoms to report (according to purpose for use). **Pregnancy risk factor X:** Not for use with postpubertal females.

Monitoring: Lab Tests

CPP: LH, FSH, estradiol or testosterone (after 1 month then every 6 months)

Prostate cancer: LH and FSH levels, serum testosterone levels, prostate specific antigen (PSA)

Patient EducationFollow directions for care of insertion site: Wait 24 hours before allowing moisture or water to touch the arm and 7 days before participating in strenuous activity or heavy lifting. Report immediately any redness, swelling, pain, drainage, or tingling at insertion site. You may experience increased or worsened symptoms (increased bone pain) during first week following insertion; these should subside. May cause hot flashes (cool cloths or a cool environment may help); dizziness, headache, insomnia, irritability (use caution when driving or engaging in tasks that require alertness until response to medication is known); enlarged or painful breasts, decreased libido, or sexual dysfunction; constipation (increased fluids and exercise may help); weight gain; or loss of hair. Report any persistent difficulty urinating; shortness of breath; muscle pain, twitching, or weakness; persistent dizziness, confusion, depression, or mood swings; or other persistent adverse reactions. **Pregnancy/breast-feeding precaution:** Not for use with postpubertal females.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Implant, subcutaneous:

Supprelin® LA: 50 mg (1) [releases ~65 mcg/day over 12 months; packaged with implantation kit]

Vantas™: 50 mg (1) [releases 50-60 mcg/day over 12 months; packaged with implantation kit]

Generic AvailableNo

ManufacturerIndevus Pharmaceuticals

Mechanism of ActionPotent inhibitor of gonadotropin secretion; continuous administration results in, after an initiation phase, the suppression of luteinizing hormone (LH), follicle-stimulating hormone (FSH), and a subsequent decrease in testosterone (females and males) and estrogen (premenopausal females). Additionally, in patients with CPP, linear growth velocity is slowed (improves chance of attaining predicted adult height).

Pharmacodynamics/Kinetics

Onset of action: Prostate cancer: Chemical castration: 2-4 weeks; CPP: progression of sexual development stops and growth is decreased in ~1 month

Duration: 1 year

Distribution: Adults: V_d: ~58 L

Protein binding: Adults: 70% ± 9%

Metabolism: Hepatic via C-terminal dealkylation and hydrolysis

Bioavailability: Adults: 92%

Half-life elimination: Adults: Terminal: ~4 hours

Time to peak, serum: Adults: 12 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue and insomnia; may rarely cause depression, dizziness, irritability, lethargy, or malaise

Mental Health: Effects on Psychiatric TreatmentMay cause sexual dysfunction; concomitant use with psychotropic agents (especially SSRIs) may produce additive effects. May cause renal dysfunction; monitor serum levels in patients receiving lithium.

Index TermsGnRH Agonist; Histrelin Acetate; LH-RH Agonist

International Brand NamesVantas (MY, SG, TH)

Homatropine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(hoe MA troe peen)

U.S. Brand NamesIsopto® Homatropine

Pharmacologic CategoryAnticholinergic Agent, Ophthalmic; Ophthalmic Agent, Mydriatic

Use: Labeled IndicationsProducing cycloplegia and mydriasis for refraction; treatment of acute inflammatory conditions of the uveal tract; optical aid in axial lens opacities

Dosing: Adults

Mydriasis and cycloplegia for refraction: Ophthalmic: Instill 1-2 drops of 2% solution or 1 drop of 5% solution before the procedure; repeat at 5- to 10-minute intervals as needed; maximum of 3 doses for refraction

Uveitis: Ophthalmic: Instill 1-2 drops of 2% or 5% 2-3 times/day up to every 3-4 hours as needed

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Mydriasis and cycloplegia for refraction: Ophthalmic: Instill 1 drop of 2% solution immediately before the procedure; repeat at 10-minute intervals as needed

Uveitis: Ophthalmic: Instill 1 drop of 2% solution 2-3 times/day

Administration: OtherOphthalmic instillation: Finger pressure should be applied to lacrimal sac for 1-2 minutes after instillation to decrease risk of absorption and systemic reactions

StorageStore at 8°C to 24°C (46°F to 75°F). Protect from light.

ContraindicationsHypersensitivity to homatropine or any component of the formulation; primary glaucoma or predisposition to glaucoma (eg, narrow-angle glaucoma)

Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Excessive use may cause CNS disturbances, including confusion, delirium, agitation, and coma (rare). May occur with any age group, although children and the elderly are more susceptible.
- Increased intraocular pressure: May cause an increase in intraocular pressure.
- Light sensitivity (ocular): May cause sensitivity to light; appropriate eye protection should be used.

Disease-related concerns:

- Down syndrome: Patients with Down syndrome are predisposed to angle-closure glaucoma; use with caution.
- Keratoconus: May result in fixed pupil dilation in patients with keratoconus; use with caution.

Special populations:

- Elderly: Use with caution in the elderly due to susceptibility to systemic effects.
- Pediatrics: Safety and efficacy have not been established in infants and young children, therefore, use with extreme caution due to susceptibility of systemic effects.

Dosage form specific issues:

- Contact lens wearers: Some strengths may contain benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

Other warnings and precautions:

- Appropriate use: To minimize systemic absorption, apply pressure over the nasolacrimal sac for 2-3 minutes after instillation. To avoid contamination, do not touch dropper tip to any surface. For topical ophthalmic use only.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Ocular: Blurred vision, photophobia

1% to 10%:

Local: Stinging, local irritation

Ocular: Increased intraocular pressure

Respiratory: Congestion

<1%: Vascular congestion, edema, drowsiness, exudate, eczematoid dermatitis, follicular conjunctivitis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as hydrobromide:

Isopto® Homatropine: 2% (5 mL); 5% (5 mL, 15 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Isopto Homatropine)

2% (5): $30.99

5% (5): $38.82

5% (15): $34.99

Mechanism of ActionBlocks response of iris sphincter muscle and the accommodative muscle of the ciliary body to cholinergic stimulation resulting in dilation and loss of accommodation

Pharmacodynamics/Kinetics

Onset of action: Accommodation and pupil effect: Ophthalmic:

Maximum mydriatic effect: Within 10-30 minutes

Maximum cycloplegic effect: Within 30-90 minutes

Duration:

Mydriasis: 6 hours to 4 days

Cycloplegia: 10-48 hours

Related Information

- Cycloplegic Mydriatics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Nasal congestion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsHomatropine Hydrobromide

Medication Safety Issues

Sound-alike/look-alike issues:

Synvisc® may be confused with Synagis®

Pronunciation(hye al yoor ON ate & dah RIV ah tives)
U.S. Brand NamesBiolon™ [DSC]; Bionect®; Euflexxa™; Healon GV®; Healon®; Healon®5; Hyalgan®; Hylaform®; Hylaform® Plus; Hylira™; IPM Wound Gel™ [OTC]; Juvederm™ 24HV; Juvederm™ 30; Juvederm™ 30HV; Orthovisc®; Perlane®; Provisc®; Restylane®; Supartz™; Synvisc®; Vitrax®
Canadian Brand NamesCystistat®; Durolane®; Eyestil; Healon GV®; Healon®; OrthoVisc®; Suplasyn®
Pharmacologic CategoryAntirheumatic, Miscellaneous; Ophthalmic Agent, Viscoelastic; Skin and Mucous Membrane Agent, Miscellaneous
Use: Labeled Indications

Intra-articular injection: Treatment of pain in osteoarthritis in knee in patients who have failed nonpharmacologic treatment and simple analgesics

Intradermal: Correction of moderate-to-severe facial wrinkles or folds

Ophthalmic: Surgical aid in cataract extraction, intraocular implantation, corneal transplant, glaucoma filtration, and retinal attachment surgery

Topical cream, gel, spray: Management of skin ulcers and wounds

Topical lotion: Treatment of xerosis (dry, scaly skin)

Use: Unlabeled/InvestigationalTreatment of refractory interstitial cystitis
Dosing: Adults

Surgical aid: Ophthalmic (Biolon™, Healon®, Provisc®, Vitrax®): Depends upon procedure (slowly introduce a sufficient quantity into eye)

Osteoarthritis of the knee: Intra-articular:

Eulexxa™: Inject 20 mg (2 mL) once weekly for 3 weeks

Hyalgan®: Inject 20 mg (2 mL) once weekly for 5 weeks; some patients may benefit with a total of 3 injections

Orthovisc®: Inject 30 mg (2 mL) once weekly for 3-4 weeks

Supartz™: Inject 25 mg (2.5 mL) once weekly for 5 weeks

Synvisc®: Inject 16 mg (2 mL) once weekly for 3 weeks (total of 3 injections)

Facial wrinkles: Intradermal

Note: Formulations differ in terms of recommended injection depth: Juvederm™, Hylaform®, and Restylane® are intended for mid to deep intradermal injection; Perlane® is intended for injection into the deep dermis to superficial subcutis

Hylaform®, Hylaform® Plus: Inject as required for cosmetic result; typical treatment regimen requires <2 mL; limit injection to ≤1.5 mL per injection site; maximum: 20 mL/60 kg/year

Perlane®: Inject as required into deep dermis/superficial subcutis for cosmetic result; typical treatment regimen requires 1.9-4.6 mL; maximum 6 mL per treatment

Juvederm™ (all formulations): Inject as required for cosmetic result; typical treatment regimen requires <2 mL; limit injection to 1.6 mL per injection site; maximum: 20 mL/60 kg/year

Restylane®): Inject as required for cosmetic result; typical treatment regimen requires <2 mL; limit injection to ≤1.5 mL per injection site

Skin ulcers and wounds:

Bionect® cream, gel, and spray: Topical: Apply a thin layer to clean and disinfected wound or ulcer 2-3 times/day, and cover with sterile gauze pad. If needed, cover with elastic or compressive bandage.

IPM Wound Gel™: Topical: Apply to clean dry ulcer or wound, and cover with nonstick dressing; repeat daily. Discontinue if wound size increase after 3-4 applications.

Xerosis (dry, scaly skin): Hylira™ lotion: Topical: Apply to affected area and rub in thoroughly 2-3 times daily. Discontinue if condition worsens.

Interstitial cystitis, refractory (unlabeled use): Intravesical (unlabeled route): 40 mg in 50 mL saline intravesically (retain in bladder for at least 30 minutes) once weekly for 4 weeks, then monthly for up to 1 year in patients showing an initial response

Dosing: ElderlyRefer to adult dosing.

Administration: Topical

Bionect® products: Clean and disinfect wound prior to use (do not use quaternary ammonium salts), and debride if necessary; apply a thin layer to wound or ulcer without extensive rubbing.

IPM Wound Gel™: Clean wound with normal saline; remove excess moisture with dry gauze; apply gel liberally to wound

Hylira™ lotion: Apply and rub in thoroughly into affected area. Avoid eyes, lips and mucous membranes.

Administration: Other

Intra-articular: Inject directly into the knee joint. Do not use disinfectants containing quaternary salts for skin cleansing prior to injection. Remove effusion, if present, prior to injection. If used for bilateral treatment, use a separate syringe for each injection site.

Intradermal: Do not inject into a blood vessel. May apply ice pack to injection site for a short period immediately after administration if treatment area swollen.

Juvederm™, Hylaform®, and Restylane® are intended for mid to deep intradermal injection

Perlane® is intended for injection into the deep dermis to superficial subcutis

Ophthalmic: Drug may become cloudy or form a slight precipitate after administration; clinical significance unknown, but cloudy or precipitated material should be removed by irrigation or aspiration

Storage

Bionect® products: Store at room temperature. Cream and gel may be stored up to 24 months; spray may be stored up to 36 months.

Euflexxa™: Store under refrigeration at 2°C to 8°C (36°F to 46°F) or at room temperature up to 25°C (77°F); do not freeze. Protect from light. If refrigerated, remove from refrigeration at least 20-30 minutes before use.

Healon® products, Provisc®: Store under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light.

Hylaform®, Hylaform® Plus: Store at room temperature of 2°C to 30°C; do not freeze. Do not use if gel separates or becomes cloudy.

Hyalgan®, Orthovisc®: Store below 25°C (77°F); do not freeze.

Hylira™ Lotion: Store at room temperature of 15°C to 30°C; do not freeze.

IPM Wound Gel™: Store below 35°C (95°F); do not freeze.

Juvederm™ (all formulations), Perlane®, Restylane®: Store at up to 25°C (77°F); do not freeze. Protect from light. Do not use if gel separates or becomes cloudy.

Synvisc®: Store at room temperature below 30°C (86°F); do not freeze. Protect from light.

Compatibility**Incompatible:** Disinfectants containing quaternary ammonium salts may precipitate hyaluronic acid. Detergents and benzalkonium chloride may cause solution to have a milky appearance.

ContraindicationsHypersensitivity to hyaluronate or any component of the formulation

Intradermal:

Hylaform®, Hylaform® Plus: Additional contraindications include hypersensitivity to avian proteins (egg products, feathers)

Juvederm™, Perlane®, Restylane®: Additional contraindications include history of or presence of multiple severe allergies; bleeding disorders; sensitivity to gram-positive bacterial proteins

Intra-articular: Knee joint infections, infections or skin diseases at the site of injection

Orthovisc®: Additional contraindications include hypersensitivity to avian proteins (egg products, feathers)

Warnings/Precautions

Dosage form specific issues:

- Injection (gel): Intradermal: Treatment may result in bruising/bleeding; use caution in patients receiving or recently exposed (≤3 weeks) to thrombolytics, anticoagulants, or platelet inhibitors. Do not inject into site of active inflammation or infection. Injection into a blood vessel may lead to localized superficial necrosis. Use in patients susceptible to keloid formation, hypertrophic scarring, or pigmentation disorders has not been studied; use cautiously. Use caution with immunosuppressive treatment. Use in patients with prior herpetic eruption may result in reactivation. Delayed inflammatory papules may result from injections, necessitating evaluation and treatment as soft tissue infection. Laser treatment or chemical peeling may cause acute inflammatory reaction. Patient must avoid exposure to ultraviolet rays (sun and UV lamp) or severe cold until swelling and redness is resolved. Treatment site reactions usually improve in <1 week. Strenuous exercise and ethanol consumption should be avoided for 24 hours following use. Supplemental “touch up” treatments may be required. Use in lip augmentation has not been established. Safety and efficacy in patients <18 years of age have not been established.

- Injection (solution): Intra-articular: Not for use in infected joints; do not use disinfectants containing quaternary salts for skin preparation (may cause precipitation of hyaluronate). Remove effusion, if present, prior to injection. Use with caution if venous or lymphatic stasis is present in the leg. Avoid strenuous activities for 48 hours after injection. Safety and efficacy have not been established in children.

- Ophthalmic: Do not overfill the anterior chamber; carefully monitor intraocular pressure.

- Topical: Bionect® products (cream, gel, spray): Do not use disinfectants containing quaternary ammonium salts for skin preparation (may cause precipitation of hyaluronate). IPM™ wound gel: Cleansing agents other than normal saline are not recommended. Hylira™ lotion: Avoid contact with eyes, lips, mucous membranes; discontinue if condition worsens.

Other warnings/precautions:

- Not for I.V. injection. Do not inject into blood vessels; may cause occlusion, infarction, embolism, or other systemic adverse events.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequencies and/or type of local reaction may vary by formulation and site of application/injection.

>10%:

Local: Injection site (intradermal): Bruising (47% to 61%), erythema (58% to 93%), lumps/bumps (79% to 83%), pain (57% to 90%), swelling (81% to 89%); pruritus (28% to 36%), skin discoloration (31% to 34%)

Respiratory: Infection (12%)

1% to 10%:

Cardiovascular: Blood pressure increased (2% to 4%)

Central nervous system: Fatigue (1%)

Gastrointestinal: Nausea (≤2%)

Local: Dry skin (intradermal >1%), peeling (intradermal >1%)

Neuromuscular & skeletal: Back pain (<1% to 6%), tendonitis (2%), parasthesia (1%)

Respiratory: Rhinitis (3%)

Frequency not defined:

Cardiovascular: Edema, flushing, hypotension, tachycardia

Central nervous system: Dizziness, headache

Dermatologic: Rash, hyperpigmentation, exfoliation

Local: Injection site: Arthralgia, nodule

Neuromuscular & skeletal: Hypokinesia (knee)

Ocular (with ophthalmic formulation): Postoperative inflammatory reactions (iritis, hypopyon), corneal edema, corneal decompensation, transient postoperative increase in IOP

Miscellaneous: Abscess formation, allergic reactions, anaphylaxis, respiratory difficulties

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersIntraocular pressure; intradermally administered products, signs and symptoms of excess local inflammation or infection

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Hylan B: Injection, gel:

Hylaform® [500 micron particle]: 5.5 mg/mL (0.75 mL) [prefilled syringe; derived from avian source]

Hylaform® Plus [700 micron particle]: 5.5 mg/mL (0.75 mL) [prefilled syringe; derived from avian source]

Mechanism of ActionSodium hyaluronate is a polysaccharide which is distributed widely in the extracellular matrix of connective tissue in man (vitreous and aqueous humor of the eye, synovial fluid, skin, and umbilical cord). Sodium hyaluronate and its derivatives form a viscoelastic solution in water (at physiological pH and ionic strength) which makes it suitable for aqueous and vitreous humor in ophthalmic surgery, and functions as a tissue and/or joint lubricant which plays an important role in modulating the interactions between adjacent tissues. Intradermal injection may decrease the depth of facial wrinkles.
Pharmacodynamics/Kinetics

Distribution: Intravitreous injection: Diffusion occurs slowly

Excretion: Ophthalmic: Via Canal of Schlemm

Pharmacotherapy PearlsJuvederm™ 24HV provides more versatility in contouring and volumizing of facial wrinkles. Juvederm™ 30 provides subtle correction for facial folds and wrinkles. Juvederm™ 30HV provides greater volumizing for correction of deeper folds and wrinkles. Perlane® differs from Restylane® in the size of its hyaluronate particles within the gel, allowing its use in deeper injections relative to other dermal fillers.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Wydase may be confused with Lidex®, Wyamine®

Pronunciation(hye al yoor ON i dase)

U.S. Brand NamesAmphadase™; Hydase™; Hylenex™; Vitrase®

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsIncrease the dispersion and absorption of other drugs; increase rate of absorption of parenteral fluids given by hypodermoclysis; adjunct in subcutaneous urography for improving resorption of radiopaque agents

Use: Unlabeled/InvestigationalManagement of drug extravasations

Dosing: Adults**Note:** A preliminary skin test for hypersensitivity can be performed. ACTH, antihistamines, corticosteroids, estrogens, and salicylates, when used in large doses, may cause tissues to be partly resistant to hyaluronidase. May require larger doses of hyaluronidase for the same effect.

Skin test: Intradermal: 0.02 mL (3 units) of a 150 units/mL solution. Positive reaction consists of a wheal with pseudopods appearing within 5 minutes and persisting for 20-30 minutes with localized itching.

Hypodermoclysis: SubQ: 15 units is added to each 100 mL of I.V. fluid to be administered; 150 units facilitates absorption of >1000 mL of solution; rate and volume of a single clysis should not exceed those used for infusion of I.V. fluids

Urography: SubQ: 75 units over each scapula followed by injection of contrast medium at the same site; patient should be in the prone position.

Extravasation (unlabeled use): SubQ: Inject 1 mL of a 150 unit/mL solution (as 5-10 injections of 0.1-0.2 mL) into affected area; doses of 15-250 units have been reported. **Note:** Do not use for extravasation of pressor agents (eg, dopamine, norepinephrine).

Dosing: ElderlyRefer to adult dosing. Adjust dose carefully to individual patient.

Dosing: Pediatric

Skin test: See "Note" in adult dosing: Intradermal: 0.02 mL (3 units) of a 150 units/mL solution. Positive reaction consists of a wheal with pseudopods appearing within 5 minutes and persisting for 20-30 minutes with localized itching.

Hypodermoclysis: SubQ: 15 units is added to each 100 mL of I.V. fluid to be administered; 150 units facilitates absorption of >1000 mL of solution

Premature Infants and Neonates: Volume of a single clysis should not exceed 25 mL/kg and the rate of administration should not exceed 2 mL/minute

Children <3 years: Volume of a single clysis should not exceed 200 mL

Children ≥3 years: Refer to adult dosing.

Urography: Refer to adult dosing.

Administration: I.V.Do **not** administer I.V.

Storage

Amphadase™, Hydase™, Hylenex™: Store in refrigerator at 2°C to 8°C (35°F to 46°F); do not freeze.

Vitrase®: Store unopened vial in refrigerator at 2°C to 8°C (35°F to 46°F). After reconstitution, store at 20°C to 25°C (68°F to 77°F) and use within 6 hours.

ReconstitutionVitrase®: Add 6.2 mL of NaCl to vial (1000 units/mL). Further dilute with NaCl before administration.

For 50 units/mL, draw up 0.05 mL of hyaluronidase reconstituted solution (1000 units/mL) and add 0.95 mL of NaCl.

For 75 units/mL, draw up 0.075 mL of hyaluronidase reconstituted solution and add 0.925 mL of NaCl.

For 150 units/mL, draw up 0.15 mL of hyaluronidase reconstituted solution and add 0.85 mL of NaCl.

For 300 units/mL, draw up 0.3 mL of hyaluronidase reconstituted solution and add 0.7 mL of NaCl.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS.

Compatibility in syringe: Compatible: Diatrizoate meglumine 34.3%, diatrizoate sodium 35%, iothalamate meglumine 60%, iothalamate sodium 80%, pentobarbital, thiopental. **Incompatible:** Hydromorphone. **Variable (consult detailed reference):** Diatrizoate meglumine 52%, diatrizoate sodium 8%, diatrizoate sodium 75%, iodipamide meglumine 52%.

Compatibility when admixed: Compatible: Amikacin, sodium bicarbonate. **Incompatible:** Benzodiazepines, epinephrine, furosemide, heparin, phenytoin.

ContraindicationsHypersensitivity to hyaluronidase or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Sensitization: Discontinue if sensitization occurs.

Other warnings/precautions:

- Administration: Do not administer intravenously; do not inject in or around infected or inflamed areas; may spread localized infection. Do not apply directly to the cornea.

- Appropriate use: Should not be used for extravasation management of dopamine or alpha agonists or to reduce swelling of bites or stings.

Geriatric ConsiderationsThe most common use of hyaluronidase in the elderly is in hypodermoclysis. Hypodermoclysis is very useful in dehydrated patients in whom oral intake is minimal and I.V. access is a problem.
Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate or well-controlled studies in pregnant women; use only if clearly needed. Administration during labor did not cause any increase in blood loss or differences in cervical trauma. It is not known whether it affects the fetus if used during labor.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

Frequency not defined:

Cardiovascular: Edema

Local: Injection site reactions

<1%: Allergic reactions, anaphylactic-like reactions (retrobulbar block or I.V. injections), angioedema, urticaria

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringResults of skin test should be assessed prior to administering. Should not be administered in or around infected or inflamed areas (see Warnings/Precautions). Teach patient possible side effects/interventions, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Note breast-feeding caution.
Patient EducationInform prescriber of any allergies you may have. This drug can only be administered by injection. Report immediately any unusual skin rash, pain, redness, or swelling at or around injection site, swelling of mouth or lips, difficulty breathing, or onset of sudden dizziness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Vitrase®: 6200 units [ovine derived; contains lactose]

Injection, solution:

Amphadase™: 150 units/mL (1 mL) [bovine derived; contains edetate disodium 1 mg, thimerosal ≤0.1 mg]

Injection, solution [preservative free]:

Hydase™: 150 units/mL (1 mL) [bovine derived; contains edetate disodium 1 mg]

Hylenex™: 150 units/mL (1 mL, 2 mL) [recombinant; contains human albumin and edetate disodium]

Vitrase®: 200 units/mL (2 mL) [ovine derived; contains lactose]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Solution (Vitrase)

200 units/mL (7.2): $234.35

Mechanism of ActionModifies the permeability of connective tissue through hydrolysis of hyaluronic acid, one of the chief components of tissue cement which offers resistance to diffusion of liquids through tissues; hyaluronidase increases both the distribution and absorption of locally injected substances.
Pharmacodynamics/Kinetics

Onset of action: SubQ: Immediate

Duration: 24-48 hours

Pharmacotherapy Pearls

Amphadase™ pH: 6.8

Hydase™: pH: 6.9, osmolality: 275-305 mOsm

Hylenex™: pH: 7.4, osmolality: 290-350 mOsm

Vitrase® pH: ~6.7

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported

Hydralazine and Hydrochlorothiazide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(hye DRAL a zeen & hye droe klor oh THYE a zide)

Pharmacologic CategoryDiuretic, Thiazide; Vasodilator, Direct-Acting

Use: Labeled IndicationsManagement of moderate to severe hypertension and treatment of congestive heart failure

Dosing: AdultsHypertension: Oral: Hydralazine 25-100 mg/day and hydrochlorothiazide 25-50 mg/day in 2 divided doses (maximum: Hydrochlorothiazide: 50 mg/day)

Dosing: ElderlyRefer to dosing in individual monographs.

Contraindications

Based on **hydralazine** component: Hypersensitivity to hydralazine or any component of the formulation; mitral valve rheumatic heart disease

Based on **hydrochlorothiazide** component: Hypersensitivity to hydrochlorothiazide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation; pregnancy

Allergy Considerations

- HydrALAZINE Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Drug-induced lupus-like syndrome: Hydralazine may cause a drug-induced lupus-like syndrome (more likely on larger doses, longer duration).
- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with hydrochlorothiazide.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Cardiovascular disease: Use hydralazine with caution in patients with coronary artery disease (CAD); increase in tachycardia may increase myocardial oxygen demand.
- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use hydrochlorothiazide with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypokalemia: Use hydrochlorothiazide with caution in patients with hypokalemia; correct before initiating.
- Pulmonary hypertension: Use hydralazine with caution in pulmonary hypertension; may cause hypotension.
- Renal impairment: Use hydralazine with caution in patients with severe renal impairment; dosage adjustment recommended; avoid hydrochlorothiazide in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSee individual agents.

LactationEnters breast milk/compatible

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsHydralazine: **Inhibits** CYP3A4 (weak)

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

25/25: Hydralazine hydrochloride 25 mg and hydrochlorothiazide 25 mg

50/50: Hydralazine hydrochloride 50 mg and hydrochlorothiazide 50 mg

100/50: Hydralazine hydrochloride 100 mg and hydrochlorothiazide 50 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Hydralazine-HCTZ)

25-25 mg (30): $22.69

50-50 mg (30): $33.60

100-50 mg (30): $15.99

Pharmacodynamics/KineticsSee individual agents.
Related Information

- HydrALAZINE
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or depression
Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may result in significant decrease in blood pressure, use cautiously; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for hydralazine and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. Thiazide therapy improves cardiovascular outcomes in patients with hypertension. Hydralazine, in combination with isosorbide dinitrate, and hydrochlorothiazide are also used in management of heart failure. See Cardiovascular Considerations for individual agents.

Index TermsApresazide [DSC]; Hydrochlorothiazide and Hydralazine

HydrALAZINE

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

HydrALAZINE may be confused with hydrOXYzine

Pronunciation(hye DRAL a zeen)

Canadian Brand NamesApo-Hydralazine®; Apresoline®; Novo-Hylazin; Nu-Hydral

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsManagement of moderate to severe hypertension, congestive heart failure, hypertension secondary to pre-eclampsia/eclampsia; treatment of primary pulmonary hypertension

Dosing: Adults

Hypertension: Oral:

Initial: 10 mg 4 times/day; increase by 10-25 mg/dose every 2-5 days (maximum: 300 mg/day); usual dose range (JNC 7): 25-100 mg/day in 2 divided doses

Acute hypertension: I.M., I.V.: Initial: 10-20 mg/dose every 4-6 hours as needed, may increase to 40 mg/dose; change to oral therapy as soon as possible.

Pre-eclampsia/eclampsia: I.M., I.V.: 5 mg/dose then 5-10 mg every 20-30 minutes as needed

Congestive heart failure: Oral:

Initial dose: 10-25 mg 3-4 times/day

Adjustment: Dosage must be adjusted based on individual response

Target dose: 225-300 mg/day in divided doses; use in combination with isosorbide dinitrate

Dosing: ElderlyOral: Initial: 10 mg 2-3 times/day; increase by 10-25 mg/day every 2-5 days.

Dosing: Pediatric

Hypertension: Oral: Initial: 0.75-1 mg/kg/day in 2-4 divided doses; increase over 3-4 weeks to maximum of 7.5 mg/kg/day in 2-4 divided doses; maximum daily dose: 200 mg/day

Acute hypertension: I.M., I.V.: 0.1-0.2 mg/kg/dose (not to exceed 20 mg) every 4-6 hours as needed, up to 1.7-3.5 mg/kg/day in 4-6 divided doses

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 8 hours.

Cl_{cr} <10 mL/minute: Administer every 8-16 hours in fast acetylators and every 12-24 hours in slow acetylators.

Hemodialysis effects: Supplemental dose is not necessary.

Peritoneal dialysis effects: Supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Inject over 1 minute. Hypotensive effect may be delayed and unpredictable in some patients.

Administration: I.V. DetailpH: 3.4-4.0

Dietary ConsiderationsAdminister with meals.

StorageIntact ampuls/vials of hydralazine should not be stored under refrigeration because of possible precipitation or crystallization.

ReconstitutionHydralazine should be diluted in NS for IVPB administration due to decreased stability in D_5W. Stability of IVPB solution in NS is 4 days at room temperature.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, $D_{10}W$, LR, $^1/_2NS$, NS; **incompatible** with D_5W.

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, verapamil, vitamin B complex with C. **Incompatible:** Aminophylline, ampicillin, diazoxide, furosemide. **Variable (consult detailed reference):** Nitroglycerin.

Compatibility when admixed: Compatible: Dobutamine. **Incompatible:** Aminophylline, ampicillin, chlorothiazide, edetate calcium disodium, ethacrynate, hydrocortisone sodium succinate, mephentermine, methohexital, nitroglycerin, phenobarbital, verapamil.

Extemporaneously PreparedAn oral solution (20 mg/5 mL) has been made from 20 mL of the hydralazine injection (20 mg/mL), 8 mL of propylene glycol and purified water USP qs ad 100 mL; expected stability: 30 days if refrigerated

A flavored syrup (1.25 mg/mL) has been made using seventy-five hydralazine hydrochloride 50 mg tablets, dissolved in 250 mL of distilled water with 2250 g of Lycasin® (75% w/w maltitol syrup vehicle); edetate disodium 3 g and sodium saccharin 3 g dissolved in 50 mL distilled water was added; solution was preserved with 30 mL of a solution containing methylparaben 10% (w/v) and propylparaben 2% (w/v) in propylene glycol; flavored with 3 mL orange flavoring; qs ad to 3 L with distilled water and then pH adjusted to pH of 3.7 using glacial acetic acid; measured stability was 5 days at room temperature (25°C); less than 2% loss of hydralazine occurred at 2 weeks when syrup was stored at 5°C

Alexander KS, Pudipeddi M, and Parker GA, "Stability of Hydralazine Hydrochloride Syrup Compounded From Tablets," *Am J Hosp Pharm*, 1993, 50(4):683-6.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 2nd ed, Cincinnati, OH: Harvey Whitney Books Co, 1992.

ContraindicationsHypersensitivity to hydralazine or any component of the formulation; mitral valve rheumatic heart disease

Warnings/Precautions

Concerns related to adverse effects:

- Drug-induced lupus-like syndrome: May cause a drug-induced lupus-like syndrome (more likely on larger doses, longer duration).
- Fluid/sodium retention: Hydralazine-induced fluid and sodium retention may require addition or increased dosage of a diuretics.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease (CAD); increase in tachycardia may increase myocardial oxygen demand.
- Pulmonary hypertension: Use with caution in pulmonary hypertension; may cause hypotension.
- Renal impairment: Use with caution in patients with severe renal impairment; dosage adjustment recommended.

Other warnings/precautions:

- I.V. administration: Monitor blood pressure closely following I.V. administration. Response may be delayed and unpredictable in some patients; titrate cautiously to response.
- Patient compliance: Patients may be poorly compliant because of frequent dosing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCrosses the placenta. One report of fetal arrhythmia; transient neonatal thrombocytopenia and fetal distress reported following late 3rd trimester use. A large amount of clinical experience with the use of this drug for management of hypertension during pregnancy is available. Available evidence suggests safe use during pregnancy.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsCrosses into breast milk in extremely small amounts. Available evidence suggests safe use during breast-feeding. AAP considers **compatible** with breast-feeding.

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia, angina pectoris, orthostatic hypotension (rare), dizziness (rare), paradoxical hypertension, peripheral edema, vascular collapse (rare), flushing

Central nervous system: Increased intracranial pressure (I.V., in patient with pre-existing increased intracranial pressure), fever (rare), chills (rare), anxiety*, disorientation*, depression*, coma*

Dermatologic: Rash (rare), urticaria (rare), pruritus (rare)

Gastrointestinal: Anorexia, nausea, vomiting, diarrhea, constipation, adynamic ileus

Genitourinary: Difficulty in micturition, impotence

Hematologic: Hemolytic anemia (rare), eosinophilia (rare), decreased hemoglobin concentration (rare), reduced erythrocyte count (rare), leukopenia (rare), agranulocytosis (rare), thrombocytopenia (rare)

Neuromuscular & skeletal: Rheumatoid arthritis, muscle cramps, weakness, tremor, peripheral neuritis (rare)

Ocular: Lacrimation, conjunctivitis

Respiratory: Nasal congestion, dyspnea

Miscellaneous: Drug-induced lupus-like syndrome (dose related; fever, arthralgia, splenomegaly, lymphadenopathy, asthenia, myalgia, malaise, pleuritic chest pain, edema, positive ANA, positive LE cells, maculopapular facial rash, positive direct Coombs' test, pericarditis, pericardial tamponade), diaphoresis

*Seen in uremic patients and severe hypertension where rapidly escalating doses may have caused hypotension leading to these effects.

Metabolism/Transport Effects**Inhibits** CYP3A4 (weak)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food enhances bioavailability of hydralazine.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure (monitor closely with I.V. use), standing and sitting/supine, heart rate, ANA titer

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact blood pressure). For infusion see Administration specifics. Orthostatic precautions should be observed and patient monitored closely during and following infusion. Assess results of laboratory tests, therapeutic effectiveness (decreased blood pressure), and adverse response (eg, hypotension, fluid retention) periodically during therapy. Teach patient proper use (oral), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsANA titer

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, with meals. Avoid alcohol. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. Weigh daily at the same time, in the same clothes for the first 2 weeks and weekly thereafter. Report weight gain >5 lb/week or swelling of feet or ankles. May cause postural hypotension, dizziness, or weakness (change position slowly when rising from sitting or lying position, climbing stairs, and avoid driving or activities requiring alertness until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); impotence (reversible); diarrhea (boiled milk, buttermilk, or yogurt may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report chest pain, rapid heartbeat, or palpitations; flu-like symptoms; respiratory difficulty; skin rash; numbness and tingling of extremities; muscle cramps, weakness, or tremors; persistent GI problems; or other adverse reactions. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 20 mg/mL (1 mL)

Tablet, as hydrochloride: 10 mg, 25 mg, 50 mg, 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (HydrALAZINE HCl)

10 mg (30): $13.99

25 mg (100): $25.99

50 mg (30): $13.99

100 mg (30): $20.00

Mechanism of ActionDirect vasodilation of arterioles (with little effect on veins) with decreased systemic resistance

Pharmacodynamics/Kinetics

Onset of action: Oral: 20-30 minutes; I.V.: 5-20 minutes

Duration: Oral: Up to 8 hours; I.V.: 1-4 hours; **Note:** May vary depending on acetylator status of patient

Distribution: Crosses placenta; enters breast milk

Protein binding: 85% to 90%

Metabolism: Hepatically acetylated; extensive first-pass effect (oral)

Bioavailability: 30% to 50%; increased with food

Half-life elimination: Normal renal function: 2-8 hours; End-stage renal disease: 7-16 hours

Excretion: Urine (14% as unchanged drug)

Related Information

- Depression

- Heart Failure (Systolic)
- Hypertension

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may result in significant decrease in blood pressure; use cautiously
Cardiovascular Considerations

Heart Failure: May be combined with isosorbide dinitrate for the treatment of heart failure. This combination has shown to decrease cardiovascular morbidity and mortality in patients with heart failure (Cohn JN, 1986). The ACC/AHA 2005 Heart Failure Guidelines suggest that the addition of hydralazine and a nitrate is reasonable for patients with reduced LVEF who are already on an ACE inhibitor and a beta-blocker for symptomatic heart failure and who have persistent symptoms or in patients who cannot tolerate an ACE inhibitor or ARB (intolerance, hypotension, renal insufficiency).

Ethnic Considerations: Isosorbide dinitrate and hydralazine may be added to a medical regimen for heart failure (ACE inhibitors and beta-blockers) in black patients with NYHA functional Class III or IV (Taylor AL, 2004).

Hypertension: For the management of hypertension, hydralazine may be used alone or in combination with other agents. It is considered to be safe for the management of blood pressure during pregnancy.

Anesthesia and Critical Care Concerns/Other ConsiderationsMay be combined with isosorbide dinitrate for the treatment of heart failure. It is considered to be safe for the management of blood pressure during pregnancy.
Index TermsApresoline [DSC]; Hydralazine Hydrochloride

Hydrochlorothiazide and Reserpine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(hye droe klor oh THYE a zide & re SER peen)

Pharmacologic CategoryCentral Monoamine-Depleting Agent; Diuretic, Thiazide; Rauwolfia Alkaloid

Use: Labeled IndicationsManagement of mild to moderate hypertension; treatment of edema in congestive heart failure and nephrotic syndrome

Dosing: AdultsHypertension: Oral: Hydrochlorothiazide 25-50 mg/day and reserpine 0.125-0.25 mg/day in 1-2 divided doses; not to exceed 50 mg hydrochlorothiazide per day

Dosing: ElderlyRefer to dosing in individual monographs.

RestrictionsNot available in U.S.

Contraindications

Based on **hydrochlorothiazide** component: Hypersensitivity to hydrochlorothiazide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation

Based on **reserpine** component: Hypersensitivity to reserpine or any component of the formulation; active peptic ulcer disease, ulcerative colitis, history of mental depression (especially with suicidal tendencies); MAO inhibitors

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: With high doses of reserpine, significant mental depression, anxiety, or psychosis may occur (uncommon at dosages <0.25 mg/day).
- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with hydrochlorothiazide.
- Orthostatic hypotension: Reserpine may cause orthostatic hypotension; use with caution in patients at risk of hypotension or in patients where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease).
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Asthma: Use reserpine with caution in patients with asthma.
- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gallstones: Use reserpine with caution in patients with gallstones.
- Gastrointestinal disease: Use reserpine with caution in patients with inflammatory bowel disease or history of peptic ulcer disease.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use hydrochlorothiazide with caution in patients with severe hepatic dysfunction. In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypokalemia: Use hydrochlorothiazide with caution in patients with hypokalemia; correct before initiating therapy.
- Parkinson's disease: Use reserpine with caution in patients with Parkinson’s disease.
- Renal impairment: Use reserpine with caution in patients with impaired renal function; avoid hydrochlorothiazide in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Electroshock therapy: Discontinue reserpine 7 days before electroshock therapy.

Pregnancy Risk FactorC
Pregnancy ConsiderationsRefer to Hydrochlorothiazide monograph.
LactationEnters breast milk/compatible
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amphetamines: Gastrointestinal Acidifying Agents may decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Beta-Blockers: Reserpine may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Reserpine may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

MAO Inhibitors: May enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Tetrabenazine: Reserpine may enhance the adverse/toxic effect of Tetrabenazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

25: Hydrochlorothiazide 25 mg and reserpine 0.125 mg

50: Hydrochlorothiazide 50 mg and reserpine 0.125 mg

Generic AvailableYes

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Hydrochlorothiazide
- Reserpine

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, depression, dizziness, headache, nightmares, nervousness, fatigue, dull sensorium, paradoxical anxiety

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may result in hypertensive crisis, avoid use; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity, monitor serum lithium levels. Use caution in patients with depression, as reserpine may worsen it or lessen the effect of the antidepressant.

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for hydrochlorothiazide and reserpine combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. Thiazide therapy improves cardiovascular outcomes in patients with hypertension. Reserpine is infrequently used as monotherapy for the treatment of hypertension due to side effects. See Cardiovascular Considerations for individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Aldactazide® may be confused with Aldactone®

Pronunciation(hye droe klor oh THYE a zide & speer on oh LAK tone)

U.S. Brand NamesAldactazide®

Canadian Brand NamesAldactazide 25®; Aldactazide 50®; Novo-Spirozine

Pharmacologic CategoryDiuretic, Thiazide; Selective Aldosterone Blocker

Use: Labeled IndicationsManagement of mild-to-moderate hypertension; treatment of edema in congestive heart failure and nephrotic syndrome, and cirrhosis of the liver accompanied by edema and/or ascites

Dosing: AdultsHypertension, edema: Oral: Hydrochlorothiazide 12.5-50 mg/day and spironolactone 12.5-50 mg/day; manufacturer labeling states hydrochlorothiazide maximum 200 mg/day, however, usual dose in JNC-7 is 12.5-50 mg/day

Dosing: ElderlyOral: Initial: 1 tablet/day; increase as necessary.

Dosing: PediatricEdema: Oral: 1.5-3 mg/kg/day in 2-4 divided doses (maximum: 200 mg/day)

Dosing: Renal ImpairmentEfficacy of hydrochlorothiazide is limited in patients with Cl_{cr} <30 mL/minute.

ContraindicationsHypersensitivity to spironolactone, hydrochlorothiazide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation; hyperkalemia

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Fixed-dose combination drugs: See “Appropriate use” below
- Tumorigenic: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with spironolactone; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.
- Gynecomastia: Related to dose and duration of spironolactone therapy.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.
- Tumorigenic: **[U.S. Boxed Warning]: Spironolactone shown to be a tumorigen in chronic toxicity animal studies. Avoid unnecessary use.**

Disease-related concerns:

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Renal impairment: Avoid hydrochlorothiazide in severe renal disease (ineffective). Spironolactone may cause hyperkalemia in patients with renal impairment.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Appropriate use:

- Fixed-dose combination drugs: **[U.S. Boxed Warning] should not be used in the initial therapy for edema or hypertension.** These conditions require individual dose titration.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsThe efficacy of hydrochlorothiazide is limited in patients with a Cl_{cr} <30 mL/minute; monitor serum potassium.
Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/use caution
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Drospirenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Avoid food with high potassium content and potassium-containing salt substitutes.

Herb/Nutraceutical: Avoid natural licorice (causes sodium and water retention and increases potassium loss).

Medication Safety Issues

Sound-alike/look-alike issues:

Dyazide® may be confused with diazoxide, Dynacin®

Maxzide® may be confused with Maxidex®, Microzide®

Pronunciation(hye droe klor oh THYE a zide & trye AM ter een)

U.S. Brand NamesDyazide®; Maxzide®; Maxzide®-25

Canadian Brand NamesApo-Triazide®; Novo-Triamzide; Nu-Triazide; Penta-Triamterene HCTZ; Riva-Zide

Pharmacologic CategoryDiuretic, Potassium Sparing; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension or edema (not recommended for initial treatment) when hypokalemia has developed on hydrochlorothiazide alone or when the development of hypokalemia must be avoided

Dosing: AdultsHypertension, edema: Oral:

Hydrochlorothiazide 25 mg and triamterene 37.5 mg: 1-2 tablets/capsules once daily

Hydrochlorothiazide 50 mg and triamterene 75 mg: $^1/_2$-1 tablet daily

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsShould be taken after meals.

Storage

Store at 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to hydrochlorothiazide, triamterene, any component of the formulation, or sulfonamide-derived drugs; anuria; acute and chronic renal insufficiency or significant renal impairment; patients receiving other potassium-sparing diuretics, potassium-containing salt substitutes, or potassium supplements (except in severe cases of hypokalemia); preexisting hyperkalemia

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Hyperkalemia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with hydrochlorothiazide.
- Hyperkalemia: **[U.S. Boxed Warning]: Hyperkalemia can occur with triamterene; patients at risk include those with renal dysfunction, diabetes mellitus, the elderly, and the severely ill. Serum potassium levels must be monitored at frequent intervals especially when dosages are changed or with any illness that may cause renal dysfunction.** Avoid potassium supplements (except in severe cases of hypokalemia), potassium-containing salt substitutes, a diet rich in potassium, or other drugs that can cause hyperkalemia. Discontinue if hyperkalemia develops.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may alter glycemic control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Kidney stones: Use triamterene with caution in patients with kidney stones.

- Parathyroid disease: With prolonged use, hydrochlorothiazide may produce pathologic changes in the parathyroid gland with hypercalcemia and hypophosphatemia. Thiazides should be discontinued prior to tests for parathyroid function.

- Renal impairment: Avoid hydrochlorothiazide in severe renal disease (ineffective). Triamterene may cause hyperkalemia in patients with renal impairment.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsThe efficacy of hydrochlorothiazide is limited in patients with a Cl_{cr} <30 mL/minute; monitor serum potassium.
Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsAlso see individual agents. Frequency not defined.

Cardiovascular: Angina, arrhythmia, postural hypotension, tachycardia

Central nervous system: Anxiety, dizziness, depression, fatigue, headache, insomnia, restlessness, vertigo

Dermatologic: Photosensitivity, purpura, rash, subacute cutaneous lupus erythematosus-like reactions, urticaria

Endocrine & metabolic: Acidosis, diabetes mellitus, hypercalcemia, hyperglycemia, hyper-/hypokalemia, hyperuricemia, hypochloremia, hypomagnesemia, hyponatremia

Gastrointestinal: Abdominal pain, anorexia, burning of tongue, constipation, diarrhea, loss of appetite, nausea, pancreatitis, sialadenitis, stomach cramps, taste alteration, tongue discoloration (bright orange), upset stomach, vomiting, xerostomia

Genitourinary: Impotence

Hematologic: Aplastic anemia, agranulocytosis, hemolytic anemia, leukopenia, thrombocytopenia, megaloblastic anemia

Hepatic: Jaundice, liver function tests (abnormal)

Neuromuscular & skeletal: Muscle cramping, parasthesia, weakness

Ocular: Xanthopsia, blurred vision (transient)

Renal: Acute renal failure, BUN increased, glycosuria, interstitial nephritis, necrotizing vasculitis, renal stone formation, serum creatinine increased, urinary sediment abnormal, urine discoloration

Respiratory: Allergic pneumonitis, dyspnea, pulmonary edema, respiratory distress

Miscellaneous: Anaphylaxis, systemic lupus erythematosus (SLE) exacerbation

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects.

Risk C: Monitor therapy

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Drospirenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Indomethacin: May enhance the nephrotoxic effect of Triamterene. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Avoid food with high potassium content and potassium-containing salt substitutes.
Monitoring ParametersMonitor blood pressure, serum electrolytes, BUN, creatinine, liver function tests, signs of hyperkalemia
Nursing: Physical Assessment/MonitoringSee individual agent for Hydrochlorothiazide.
Monitoring: Lab TestsSerum electrolytes, BUN, creatinine, liver function tests
Patient EducationSee individual agent for Hydrochlorothiazide.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral: Hydrochlorothiazide 25 mg and triamterene 37.5 mg; hydrochlorothiazide 25 mg and triamterene 50 mg

Dyazide®: Hydrochlorothiazide 25 mg and triamterene 37.5 mg

Tablet: Hydrochlorothiazide 25 mg and triamterene 37.5 mg; hydrochlorothiazide 50 mg and triamterene 75 mg

Maxzide®: Hydrochlorothiazide 50 mg and triamterene 75 mg [scored]

Maxzide®-25: Hydrochlorothiazide 25 mg and triamterene 37.5 mg [scored]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Dyazide)

37.5-25 mg (30): $40.99

Capsules (Triamterene-HCTZ)

37.5-25 mg (100): $15.99

50-25 mg (100): $49.99

Tablets (Maxzide)

75-50 mg (30): $61.59

Tablets (Maxzide-25)

37.5-25 mg (30): $34.09

Tablets (Triamterene-HCTZ)

37.5-25 mg (100): $29.99

75-50 mg (100): $17.99

Mechanism of Action

Based on **triamterene** component: Interferes with potassium/sodium exchange (active transport) in the distal tubule, cortical collecting tubule and collecting duct by inhibiting sodium, potassium-ATPase; decreases calcium excretion; increases magnesium loss

Based on **hydrochlorothiazide** component: Inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions

Pharmacodynamics/Kinetics See individual agents.

Related Information

- Hydrochlorothiazide
- Triamterene

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause lethargy or anorexia

Mental Health: Effects on Psychiatric Treatment May decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations Thiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. The initial concern about thiazide diuretic-induced hypokalemia, glucose intolerance, and lipid profiles does not appear to be of substantial clinical consequence in the treatment of hypertension. The benefits of this class of agents in the treatment of hypertension is established and compares well with other first-line therapeutic agents. The combination of hydrochlorothiazide and triamterene may reduce the incidence of hypokalemia.

Diuretics are standard therapy for the management of edema in patients with heart failure.

Index Terms Triamterene and Hydrochlorothiazide

Medication Safety Issues

Sound-alike/look-alike issues:

Esidrix may be confused with Lasix®

HCTZ is an error-prone abbreviation (mistaken as hydrocortisone)

Hydrochlorothiazide may be confused with hydrocortisone, hydroflumethiazide

Microzide™ may be confused with Maxzide®, Micronase®

International issues:

Microzide™ may be confused with Nitrobide® which is a brand name for isosorbide dinitrate in Japan

Microzide™ may be confused with Mikrozid® which is a brand name for ethanol/propanol combination in Great Britain

Pronunciation(hye droe klor oh THYE a zide)

U.S. Brand NamesMicrozide®

Canadian Brand NamesApo-Hydro®; Novo-Hydrazide; PMS-Hydrochlorothiazide

Pharmacologic CategoryDiuretic, Thiazide

Use: Labeled IndicationsManagement of mild to moderate hypertension; treatment of edema in congestive heart failure and nephrotic syndrome

Use: Unlabeled/InvestigationalTreatment of lithium-induced diabetes insipidus

Dosing: Adults

Edema (diuresis): Oral: 25-100 mg/day in 1-2 doses; maximum: 200 mg/day

Hypertension: Oral: 12.5-50 mg/day; minimal increase in response and more electrolyte disturbances are seen with doses >50 mg/day

Dosing: ElderlyOral: 12.5-25 mg once daily; minimal increase in response and more electrolyte disturbances are seen with doses >50 mg/day (see Special Geriatric Considerations).

Dosing: PediatricHypertension, edema (diuretic): Oral (effect of drug may be decreased when used every day):

<6 months: 1-3 mg/kg/day in 2 divided doses

>6 months to 2 years: 1-3 mg/kg/day in 2 divided doses; maximum: 37.5 mg/day

>2-17 years: Initial: 1 mg/kg/day; maximum: 3 mg/kg/day (50 mg/day)

Note: In pediatric patients, chlorothiazide may be preferred over hydrochlorothiazide as there are more dosage formulations (eg, suspension) available.

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Avoid use. Usually ineffective with GFR <30 mL/minute. Effective at lower GFR in combination with a loop diuretic.

Administration: OralMay be taken with food or milk. Take early in day to avoid nocturia. Take the last dose of multiple doses no later than 6 PM unless instructed otherwise.

ContraindicationsHypersensitivity to hydrochlorothiazide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation; pregnancy

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations.
- Hypokalemia: Use with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Avoid in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Can cause SLE exacerbation or activation.

Geriatric ConsiderationsHydrochlorothiazide is not effective in patients with a Cl_{cr} <30 mL/minute, therefore, it may not be a useful agent in many elderly patients.
Pregnancy Risk FactorB (manufacturer); D (expert analysis)
Pregnancy ConsiderationsAlthough there are no adequate and well-controlled studies using hydrochlorothiazide in pregnancy, thiazide diuretics may cause an increased risk of congenital defects. Hypoglycemia, hypokalemia, hyponatremia, jaundice, and thrombocytopenia are also reported as possible complications to the fetus or newborn.
LactationEnters breast milk/use caution (AAP rates “compatible”)
Adverse Reactions

1% to 10%:

Cardiovascular: Orthostatic hypotension, hypotension

Dermatologic: Photosensitivity

Endocrine & metabolic: Hypokalemia

Gastrointestinal: Anorexia, epigastric distress

<1% (Limited to important or life-threatening): Agranulocytosis, allergic myocarditis, allergic reactions (possibly with life-threatening anaphylactic shock), alopecia, aplastic anemia, eosinophilic pneumonitis, erythema multiforme, exfoliative dermatitis, hemolytic anemia, hepatic function impairment, hypercalcemia, interstitial nephritis, leukopenia, pancreatitis, renal failure, respiratory distress, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Hydrochlorothiazide peak serum levels may be decreased if taken with food. This product may deplete potassium, sodium, and magnesium.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Dong quai may also cause photosensitization. Avoid ephedra, ginseng, yohimbe (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Test InteractionsIncreased creatine phosphokinase [CPK] (S), ammonia (B), amylase (S), calcium (S), chloride (S), cholesterol (S), glucose, increased acid (S), decreased chloride (S), magnesium, potassium (S), sodium (S); Tyramine and phentolamine tests, histamine tests for pheochromocytoma

Monitoring ParametersAssess weight, I & O reports daily to determine fluid loss; blood pressure, serum electrolytes, BUN, creatinine

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy (sulfonamides). Assess potential for interactions with other pharmacological or herbal products patient may be taking (altered affect of oral hypoglycemics, increased risk of hypotension, or toxicity). Assess results of laboratory tests (electrolytes, BUN, creatinine), therapeutic effectiveness (according to purpose for use), and adverse response (eg, hypotension, hypokalemia, confusion) regularly during therapy. Caution patients with diabetes to monitor glucose levels closely; may alter glucose control. Teach proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes, BUN, creatinine

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. Take as directed, with meals, early in the day to avoid nocturia. Your prescriber may prescribe a potassium supplement or recommend that you eat foods high in potassium (include bananas and/or orange juice in daily diet). Do not change your diet on your own while taking this medication, especially if you are taking potassium supplements or medications to reduce potassium loss; too much potassium can be as harmful as too little. If you have diabetes, monitor serum glucose closely; this medication may increase serum glucose levels. May cause dizziness or postural hypotension (use caution when rising from sitting or lying position, when driving, climbing stairs, or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); impotence (reversible); constipation (increased exercise, fluids, fruit, or fiber may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent flu-like symptoms, chest pain, palpitations, muscle cramping, respiratory difficulty, skin rash or itching, unusual bruising or easy bleeding, or excessive fatigue. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 12.5 mg

Microzide®: 12.5 mg

Tablet: 25 mg, 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Microzide)

12.5 mg (30): $30.99

Tablets (Hydrochlorothiazide)

25 mg (100): $12.99

50 mg (100): $15.99

Mechanism of ActionInhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions

Pharmacodynamics/Kinetics

Onset of action: Diuresis: ~2 hours

Peak effect: 4-6 hours

Duration: 6-12 hours

Absorption: ~50% to 80%

Distribution: 3.6-7.8 L/kg

Protein binding: 68%

Metabolism: Not metabolized

Bioavailability: 50% to 80%

Half-life elimination: 5.6-14.8 hours

Time to peak: 1-2.5 hours

Excretion: Urine (as unchanged drug)

Related Information

- Sulfonamide Derivatives

Pharmacotherapy PearlsIf given the morning of surgery it may render the patient volume depleted and blood pressure may be labile during general anesthesia. Effect of drug may be decreased when used every day.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension and hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentUsed to treat lithium-induced diabetes insipidus; monitor for hypokalemia; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Hypertension: Thiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. They may act synergistically to lower blood pressure when combined with an ACE inhibitor or beta-blocker. The initial concern about thiazide diuretic-induced hypokalemia, glucose intolerance, and lipid profiles does not appear to be of substantial clinical consequence in the treatment of hypertension. The benefits of this class of agents in the treatment of hypertension is established and compares well with other first-line therapeutic agents. The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The JNC 7 recommends diuretics for the treatment of hypertension with concurrent heart failure where diuresis is also required (loop diuretics may more frequently be required), high coronary disease risk (as in the ALLHAT trial), diabetes (beneficial in reducing CVD and stroke incidence), and recurrent stroke prevention (in combination with an ACE inhibitor). Thiazides are useful in slowing demineralization in osteoporosis, but need to be used cautiously in gout and in patients with significant history of hyponatremia.

Diuretics are standard therapy for the management of edema in patients with heart failure. However, it is important to ensure that edema is not secondary to pericardial effusion. Marked reduction in intravascular volume with consequent decreased cardiac filling pressures may precipitate significant hypotension in these circumstances.

Anesthesia and Critical Care Concerns/Other ConsiderationsIf given the morning of surgery it may render the patient volume depleted and blood pressure may be labile during general anesthesia.

Thiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. They may act synergistically to lower blood pressure when combined with an ACE inhibitor or beta-blocker.

Pharmacologic CategoryAnalgesic Combination (Opioid)

Use: Labeled IndicationsRelief of moderate to severe pain

Use: DentalTreatment of postoperative pain

Dosing: Adults

Pain management (analgesic): Oral (doses should be titrated to appropriate analgesic effect): Average starting dose in opioid naive patients: Hydrocodone 5-10 mg 4 times/day; the dosage of acetaminophen should be limited to ≤4 g/day (and possibly less in patients with hepatic impairment or ethanol use).

Dosage ranges (based on specific product labeling): Hydrocodone 2.5-10 mg every 4-6 hours; maximum: 60 mg hydrocodone/day (maximum dose of hydrocodone may be limited by the acetaminophen content of specific product)

Dosing: ElderlyDoses should be titrated to appropriate analgesic effect; 2.5-5 mg of the hydrocodone component every 4-6 hours. Do not exceed 4 g/day of acetaminophen.

Dosing: Pediatric

Pain management (analgesic): Oral (doses should be titrated to appropriate analgesic effect):

Children 2-13 years or <50 kg: Hydrocodone 0.1-0.2 mg/kg/dose every 4-6 hours; do not exceed 6 doses/day or the maximum recommended dose of acetaminophen

Children ≥50 kg: Refer to adult dosing.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

RestrictionsC-III

ContraindicationsHypersensitivity to hydrocodone, acetaminophen, or any component of the formulation; CNS depression; severe respiratory depression

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: Hydrocodone may obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenocortical insufficiency: Use with caution in patients with adrenocortical insufficiency, including Addison's disease.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- Drug abuse: Use hydrocodone with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- G6PD deficiency: Use with caution in patients with known G6PD deficiency.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use hydrocodone with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Psychosis: Use with caution in patients with toxic psychosis.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use hydrocodone with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages. May suppress cough reflex; use with caution postoperatively and in patients with pulmonary disease.

- Seizures: Use with caution in patients with a history of seizure disorders.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsElderly may be particularly susceptible to the CNS depressant action (sedation, confusion) and constipating effects of narcotics. If 1 tablet/dose is used, it may be useful to add an additional 325 mg of acetaminophen to maximize analgesic effect.
Pregnancy Risk FactorC/D (prolonged use or high doses near term)
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination product. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery. Also refer to Acetaminophen monograph.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsAcetaminophen and hydrocodone are excreted in breast milk. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy. Also refer to Acetaminophen monograph.
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, cardiac arrest, circulatory collapse, coma, hypotension

Central nervous system: anxiety, dizziness, drowsiness, dysphoria, euphoria, fear, lethargy, lightheadedness, malaise, mental clouding, mental impairment, mood changes, physiological dependence, sedation, somnolence, stupor

Dermatologic: Pruritus, rash

Endocrine & metabolic: Hypoglycemic coma

Gastrointestinal: Abdominal pain, constipation, gastric distress, heartburn, nausea, peptic ulcer, vomiting, xerostomia

Genitourinary: Ureteral spasm, urinary retention, vesical sphincter spasm

Hematologic: Agranulocytosis, bleeding time prolonged, hemolytic anemia, iron deficiency anemia, occult blood loss, thrombocytopenia

Hepatic: Hepatic necrosis, hepatitis

Neuromuscular & skeletal: Skeletal muscle rigidity

Otic: Hearing impairment or loss (chronic overdose)

Renal: Renal toxicity, renal tubular necrosis

Respiratory: Acute airway obstruction, apnea, dyspnea, respiratory depression (dose related)

Miscellaneous: Allergic reactions, clamminess, diaphoresis

Metabolism/Transport Effects

Hydrocodone: **Substrate** (minor) of CYP2D6, 3A

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression); consuming ≥3 alcoholic drinks/day may increase the risk of liver damage

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of excessive sedation).

Monitoring ParametersPain relief, respiratory and mental status, blood pressure

Nursing: Physical Assessment/MonitoringSee individual agent for Acetaminophen.

Patient EducationSee individual agent for Acetaminophen. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

- Margesic® H, Stagesic™: Hydrocodone bitartrate 5 mg and acetaminophen 500 mg

Elixir: Hydrocodone bitartrate 7.5 mg and acetaminophen 500 mg per 15 mL (480 mL)

- Lortab®: Hydrocodone bitartrate 7.5 mg and acetaminophen 500 mg per 15 mL (480 mL) [contains ethanol 7%, propylene glycol; tropical fruit punch flavor]

Solution, oral: Hydrocodone bitartrate 7.5 mg and acetaminophen 500 mg per 15 mL (5 mL, 10 mL, 15 mL, 118 mL, 473 mL)

- hycet™: Hydrocodone bitartrate 7.5 mg and acetaminophen 325 mg per 15 mL (473 mL) [contains ethanol 6.7%, propylene glycol; fruit flavor]
- Zamicet™: Hydrocodone bitartrate 10 mg and acetaminophen 325 mg per 15 mL (473 mL) [contains ethanol 6.7%, propylene glycol; fruit flavor]

Tablet:

- Hydrocodone bitartrate 2.5 mg and acetaminophen 500 mg
- Hydrocodone bitartrate 5 mg and acetaminophen 325 mg
- Hydrocodone bitartrate 5 mg and acetaminophen 500 mg
- Hydrocodone bitartrate 7.5 mg and acetaminophen 325 mg
- Hydrocodone bitartrate 7.5 mg and acetaminophen 500 mg
- Hydrocodone bitartrate 7.5 mg and acetaminophen 650 mg
- Hydrocodone bitartrate 7.5 mg and acetaminophen 750 mg
- Hydrocodone bitartrate 10 mg and acetaminophen 325 mg
- Hydrocodone bitartrate 10 mg and acetaminophen 500 mg
- Hydrocodone bitartrate 10 mg and acetaminophen 650 mg
- Hydrocodone bitartrate 10 mg and acetaminophen 660 mg
- Hydrocodone bitartrate 10 mg and acetaminophen 750 mg
- Co-Gesic® 5/500: Hydrocodone bitartrate 5 mg and acetaminophen 500 mg
- Lorcet® 10/650: Hydrocodone bitartrate 10 mg and acetaminophen 650 mg
- Lorcet® Plus: Hydrocodone bitartrate 7.5 mg and acetaminophen 650 mg
- Lortab®:
  - 5/500: Hydrocodone bitartrate 5 mg and acetaminophen 500 mg
  - 7.5/500: Hydrocodone bitartrate 7.5 mg and acetaminophen 500 mg
  - 10/500: Hydrocodone bitartrate 10 mg and acetaminophen 500 mg
- Maxidone™: Hydrocodone bitartrate 10 mg and acetaminophen 750 mg
- Norco®:
  - Hydrocodone bitartrate 5 mg and acetaminophen 325 mg
  - Hydrocodone bitartrate 7.5 mg and acetaminophen 325 mg
  - Hydrocodone bitartrate 10 mg and acetaminophen 325 mg
- Vicodin®: Hydrocodone bitartrate 5 mg and acetaminophen 500 mg
- Vicodin® ES: Hydrocodone bitartrate 7.5 mg and acetaminophen 750 mg
- Vicodin® HP: Hydrocodone bitartrate 10 mg and acetaminophen 660 mg
- Xodol®:
  - 10/300: Hydrocodone bitartrate 10 mg and acetaminophen 300 mg
  - 5/300: Hydrocodone bitartrate 5 mg and acetaminophen 300 mg
  - 7/300: Hydrocodone bitartrate 7 mg and acetaminophen 300 mg
- Zydone®:
  - Hydrocodone bitartrate 5 mg and acetaminophen 400 mg
  - Hydrocodone bitartrate 7.5 mg and acetaminophen 400 mg

Hydrocodone bitartrate 10 mg and acetaminophen 400 mg

Mechanism of ActionHydrocodone, as with other narcotic (opiate) analgesics, blocks pain perception in the cerebral cortex by binding to specific receptor molecules (opiate receptors) within the neuronal membranes of synapses. This binding results in a decreased synaptic chemical transmission throughout the CNS thus inhibiting the flow of pain sensations into the higher centers. Mu and kappa are the two subtypes of the opiate receptor which hydrocodone binds to cause analgesia.

Acetaminophen inhibits the synthesis of prostaglandins in the CNS and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center.

Pharmacodynamics/Kinetics

Acetaminophen: See Acetaminophen monograph.

Hydrocodone:

Onset of action: Narcotic analgesic: 10-20 minutes

Duration: 4-8 hours

Distribution: Crosses placenta

Metabolism: Hepatic; O-demethylation; N-demethylation and 6-ketosteroid reduction

Half-life elimination: 3.3-4.4 hours

Excretion: Urine

Related Information

- Acetaminophen
- Narcotic / Opioid Analgesics

Dental Health Professional ConsiderationsNeither hydrocodone nor acetaminophen elicit anti-inflammatory effects. Because of addiction liability of opiate analgesics, the use of hydrocodone should be limited to 2-3 days postoperatively for treatment of dental pain. Nausea is the most common adverse effect seen after use in dental patients; sedation and constipation are second. Nausea elicited by narcotic analgesics is centrally mediated and the presence or absence of food will not affect the degree nor incidence of nausea.

Acetaminophen:

A study by Hylek, et al, suggested that the combination of acetaminophen with warfarin (Coumadin®) may cause enhanced anticoagulation. The following recommendations have been made by Hylek, et al, and supported by an editorial in *JAMA* by Bell.

Dose and duration of acetaminophen should be as low as possible, individualized and monitored

The study by Hylek reported the following:

For patients who reported taking the equivalent of at least 4 regular strength (325 mg) tablets for longer than a week, the odds of having an INR >6.0 were increased 10-fold above those not taking acetaminophen. Risk decreased with lower intakes of acetaminophen reaching a background level of risk at a dose of 6 or fewer 325 mg tablets per week.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause confusion; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentMay result in loss of pain control when used in combination with SSRIs (especially paroxetine and fluoxetine); concurrent use with psychotropics may produce additive sedation

Cardiovascular ConsiderationsMay cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Anesthesia and Critical Care Concerns/Other ConsiderationsDoses of agent must be individualized according to degree of pain; commonly used in place of Tylenol® with Codeine; patients on this drug chronically should have liver function monitored secondary to acetaminophen in the product. Keep acetaminophen dose ≤4 g/day. Patients with chronic alcoholism, liver disease, or those who are fasting can develop severe hepatic disease even at therapeutic doses.

Index TermsAcetaminophen and Hydrocodone

Special Alerts

Tussionex® Pennkinetic® Extended-Release Suspension Associated With Life-Threatening Adverse Events - March 2008

The Food and Drug Administration (FDA) has issued a public health advisory to highlight safe and appropriate use of Tussionex® Pennkinetic® Extended-Release Suspension (Tussionex®). The FDA has received reports of life-threatening adverse events and death in pediatric and adult patients receiving Tussionex® due to inappropriate prescribing and/or use. Tussionex®, a long-acting combination product containing hydrocodone and chlorpheniramine, is indicated for use in patients ≥6 years of age. It is not to be given more frequently than every 12 hours. Tussionex® is contraindicated in children <6 years of age due to increased susceptibility to life-threatening and fatal respiratory depression. Reports received by the FDA indicate this product is being inappropriately prescribed in children <6 years, dosed more frequently than every 12 hours, and is being administered using inappropriate dosing devices. Healthcare providers are urged to review dosing recommendations prior to prescribing or dispensing Tussionex®. Healthcare providers, patients, and caregivers should be alerted to the signs/symptoms of hydrocodone overdose, including difficulty breathing, slow or shallow breathing, slow heart beat, severe sleepiness, cold, clammy skin, trouble walking or talking, feeling faint, dizzy, or confused. Patients and caregivers should also be instructed on the use of proper measuring devices (calibrated oral syringes are most accurate) and be warned against using household teaspoons or tablespoons.

For more information, refer to:

http://www.fda.gov/cder/drug/infopage/hydrocodone/default.htm

Medication Safety Issues

Sound-alike/look-alike issues:

> Tussionex® represents a different product in the U.S. than it does in Canada. In the U.S., Tussionex® contains hydrocodone and chlorpheniramine, while in Canada the product bearing this name contains hydrocodone and phenyltoloxamine.

Pronunciation(hye droe KOE done & klor fen IR a meen)
U.S. Brand NamesTussiCaps™; Tussionex®
Pharmacologic CategoryAnalgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation
Use: Labeled IndicationsSymptomatic relief of cough and upper respiratory symptoms associated with cold and allergy
Dosing: AdultsAntitussive/antihistamine: Oral:

TussiCaps™ 10 mg/8 mg: One capsule every 12 hours (maximum: 2 capsules/24 hours)

Tussionex®: 5 mL every 12 hours; do not exceed 10 mL/24 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAntitussive/antihistamine: Oral:

Children 6-12 year:

> TussiCaps™: 5 mg/4 mg: One capsule every 12 hours (maximum: 2 capsules/24 hours)
>
> Tussionex®: 2.5 mL every 12 hours; do not exceed 5 mL/24 hours

Children >12 years: Refer to adult dosing.

Administration: Oral

Capsule: Administer with or without food. Do not dilute with fluid or mix with other medications. Do not give more frequently than every 12 hours.

Suspension: Shake well before using. Use calibrated oral syringe to measure doses. Do not give more frequently than every 12 hours.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
RestrictionsC-III
ContraindicationsHypersensitivity to hydrocodone, chlorpheniramine, or any component of the formulation; children <6 years of age
Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

- Respiratory depression: May cause dose-related respiratory depression, risk increased in children, elderly, patients with pulmonary disease, and when used postoperatively.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Obstructive bowel disease: Use with caution in patients with obstructive bowel disease.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Use with caution in children ≥6 years of age; may be more sensitive to adverse effects. Contraindicated in children <6 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

- Frequency of dosing: Appropriate use: Should not be given any more frequently than every 12 hours.

- Measuring device: Appropriate use: Accurate measuring devices should be used to measure suspension doses. Calibrated oral syringes are most accurate. Household teaspoons and tablespoons are not recommended for measurement.

Pregnancy Risk FactorC
Pregnancy ConsiderationsHydrocodone is teratogenic in animal studies. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsHydrocodone is excreted in breast milk; information for chlorpheniramine is not available. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy.
Adverse ReactionsAlso refer to Chlorpheniramine monograph. Frequency not defined.

Cardiovascular: Chest tightness

Central nervous system: Anxiety, dizziness, drowsiness, dysphoria, euphoria, fear, lethargy, mental impairment, mood changes, sedation

Dermatologic: Pruritus, rash

Gastrointestinal: Constipation, nausea, vomiting

Genitourinary: Ureteral spasm, urinary retention, vesicle sphincter spasm

Respiratory: Dryness of pharynx, respiratory depression

Miscellaneous: Psychological dependence

Metabolism/Transport Effects

Hydrocodone: **Substrate** (minor) of CYP2D6, 3A

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Patient Education

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

TussiCaps™ 5 mg/4 mg: Hydrocodone polistirex [equivalent to hydrocodone bitartrate 5 mg] and chlorpheniramine polistirex [equivalent to chlorpheniramine maleate 4 mg]

TussiCaps™ 10 mg/8 mg: Hydrocodone polistirex [equivalent to hydrocodone bitartrate 10 mg] and chlorpheniramine polistirex [equivalent to chlorpheniramine maleate 8 mg]

Suspension, extended release:

Tussionex®: Hydrocodone polistirex [equivalent to hydrocodone bitartrate 10 mg] and chlorpheniramine polistirex [equivalent to chlorpheniramine maleate 8 mg] per 5 mL (480 mL)

Generic Available

No

Pricing: U.S. (www.drugstore.com)

Liquid, controlled release (Tussionex Pennkinetic ER)

8-10 mg/5 mL (60): $50.36

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression

Chlorpheniramine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/Kinetics

Chlorpheniramine: See Chlorpheniramine monograph.

Hydrocodone:

Duration: 4-8 hours

Metabolism: Hepatic; O-demethylation; N-demethylation and 6-ketosteroid reduction

Half-life elimination: 3.3-4.4 hours

Excretion: Urine

Related Information

- Chlorpheniramine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause confusion, dizziness, excitability, nervousness, fatigue, or depression; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentMay result in loss of pain control when used in combination with SSRIs (especially paroxetine and fluoxetine); concurrent use with psychotropics may produce additive sedation or dry mouth

Index TermsChlorpheniramine Maleate and Hydrocodone Bitartrate ; Hydrocodone Polistirex and Chlorpheniramine Polistirex

U.S. Brand NamesAtuss® HX [DSC]; Codiclear® DH [DSC]; EndaCof [DSC]; EndaCof-XP [DSC]; ExeClear [DSC]; ExeCof-XP [DSC]; Extendryl® HC [DSC]; Hycotuss® [DSC]; Kwelcof® [DSC]; Maxi-Tuss HCG [DSC]; Pancof-XP [DSC]; Phanatuss® HC [DSC]; Pneumotussin® [DSC]; Touro® HC [DSC]; Tusso-DF® [DSC]; Vitussin [DSC]; Xpect-HC™ [DSC]; Ztuss™ ZT [DSC]

Pharmacologic CategoryAntitussive/Expectorant

Use: Labeled IndicationsSymptomatic relief of nonproductive coughs associated with upper and lower respiratory tract congestion

Dosing: Adults**Expectorant/antitussive:** Oral:

Atuss® HX: 1-2 capsules every 8 hours

Codiclear® DH, Kwelcof®, ExeClear, Hycotuss®: 5-15 mL every 4 hours, after meals and at bedtime (maximum: 30 mL/24 hours)

Maxi-Tuss HCG: 5-10 mL every 4 hours, after meals and at bedtime

Pneumotussin®: 1-2 tablets or 10 mL every 4-6 hours (maximum: 4 doses/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Expectorant/antitussive:** Oral: Children:

<6 years (unlabeled): Hydrocodone 0.3 mg/kg/day in 4 divided doses

6-12 years:

Atuss® Hx: 1 capsule every 8 hours

Codiclear® DH, ExeClear, Hycotuss®, Kwelcof®, Maxi-Tuss HCG: 2.5-5 mL every 4 hours, after meals and at bedtime

Pneumotussin®: One tablet or 5 mL every 4-6 hours (maximum: 4 doses/24 hours)

>12 years:

Codiclear® DH, ExeClear, Hycotuss®, Kwelcof®, Maxi-Tuss HCG: 5-10 mL every 4 hours, after meals and at bedtime

Pneumotussin®: 1-2 tablets or 10 mL every 4-6 hours (maximum: 4 doses/24 hours)

≥12 years (Atuss® Hx): Refer to adult dosing.

Dietary ConsiderationsShould be taken after meals. EndaCof-XP contains phenylalanine.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-III

ContraindicationsHypersensitivity to hydrocodone, guaifenesin, or any component of the formulation; increased intracranial pressure; depressed ventilation

Allergy Considerations

- GuaiFENesin Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Use with caution in children; may be more sensitive to adverse effects.

- Post-op patients: Use with caution postoperatively; causes respiratory depression.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsHydrocodone is excreted in breast milk; information for guaifenesin is not available. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, postural hypotension, palpitation

Central nervous system: Drowsiness, sedation, mental clouding, mental and physical impairment, anxiety, fear, dysphoria, dizziness, psychotic dependence, mood changes

Gastrointestinal: Nausea, vomiting, constipation with prolonged use, xerostomia

Genitourinary: Ureteral spasm, urinary retention

Ocular: Blurred vision

Respiratory: Respiratory depression (dose related)

Metabolism/Transport EffectsHydrocodone: **Substrate** (minor) of CYP2D6, 3A
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Test InteractionsGuaifenesin: Possible color interference with determination of 5-HIAA and VMA

Nursing: Physical Assessment/MonitoringSee individual agent for Guaifenesin.

Patient EducationSee individual agent for Guaifenesin. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

Ztuss™ ZT: Hydrocodone bitartrate 5 mg and guaifenesin 300 mg [DSC]

Touro® HC: Hydrocodone bitartrate 5 mg and guaifenesin 575 mg [DSC]

Tablet, sustained release:

Extendryl® HC: Hydrocodone bitartrate 10 mg and guaifenesin 1000 mg [DSC]

Xpect-HC™: Hydrocodone bitartrate 5 mg and guaifenesin 600 mg [DSC]

Generic AvailableYes: Liquid, syrup

Pricing: U.S. (www.drugstore.com)

Syrup (Hycotuss Expectorant)

5-100 mg/5 mL (120): $25.46

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression

Guaifenesin is thought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity

Pharmacodynamics/Kinetics

Guaifenesin: See Guaifenesin monograph.

Hydrocodone:

Onset of action: Narcotic analgesic: 10-20 minutes

Duration: 4-8 hours

Distribution: Crosses placenta

Metabolism: Hepatic; O-demethylation; N-demethylation and 6-ketosteroid reduction

Half-life elimination: 3.3-4.4 hours

Excretion: Urine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(hye droe KOE done & eye byoo PROE fen)

U.S. Brand NamesIbudone™; Reprexain®; Vicoprofen®

Canadian Brand NamesVicoprofen®

Pharmacologic CategoryAnalgesic, Opioid; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsShort-term (generally <10 days) management of moderate to severe acute pain; is not indicated for treatment of such conditions as osteoarthritis or rheumatoid arthritis

Use: DentalShort-term management (generally <10 days) of moderate-to-severe acute postoperative dental pain where an anti-inflammatory effect is desired

Dosing: AdultsAnalgesic: Oral: 1 tablet every 4-6 hours as needed for pain; maximum: 5 tablets/day. **Note:** Short-term use is recommended (<10 days).

Dosing: ElderlyUse with caution; consider reduced doses. Refer to dosing in individual monographs.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsC-III; An FDA-approved medication guide for NSAIDs must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to hydrocodone, ibuprofen, or any component of the formulation; patients who have experienced asthma, urticaria, or allergic-type reactions to aspirin or other NSAIDs; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings (related to ibuprofen):

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, oxycodone, oxymorphone).

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Abdominal conditions: Hydrocodone may obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenocortical insufficiency: Use with caution in patients with adrenocortical insufficiency, including Addison's disease.

- Asthma: Do not administer NSAIDs to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Biliary tract impairment: Use hydrocodone with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use of NSAIDs is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Drug abuse: Use hydrocodone with caution in patients with a potential for or a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use hydrocodone with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Psychosis: Use with caution in patients with toxic psychosis.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

- Respiratory disease: Use hydrocodone with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages. May suppress cough reflex; use with caution postoperatively and in patients with pulmonary disease.

- Seizures: Use with caution in patients with a history of seizure disorders.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly are at increased risk for adverse effects from NSAIDs. As many as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations; however, elderly patients may demonstrate these adverse effects at lower doses than younger adults. The elderly are also at increased risk of renal toxicity.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsAs with other NSAID-containing products, this agent should be avoided in late pregnancy because it may cause premature closure of the ductus arteriosus. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery. Also refer to Ibuprofen monograph.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsHydrocodone and ibuprofen are excreted in breast milk. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy. Also refer to Ibuprofen monograph.

Adverse Reactions

>10%:

Central nervous system: Headache (27%), somnolence (22%), dizziness (14%)

Gastrointestinal: Constipation (22%), nausea (21%), dyspepsia (12%)

1% to 10%:

Cardiovascular: Edema (3% to 9%), palpitation (<3%), vasodilation (<3%)

Central nervous system: Anxiety (3% to 9%), insomnia (3% to 9%), nervousness (3% to 9%), confusion (<3%), fever (<3%), pain (<3%), thought abnormalities (<3%)

Dermatologic: Pruritus (3% to 9%)

Gastrointestinal: Abdominal pain (3% to 9%), diarrhea (3% to 9%), flatulence (3% to 9%), vomiting (3% to 9%), xerostomia (3% to 9%), anorexia (<3%), gastritis (<3%), melena (<3%), mouth ulcers (<3%)

Genitourinary: Polyuria (<3%)

Neuromuscular & skeletal: Weakness (3% to 9%), hypertonia (<3%), paresthesia (<3%)

Otic: Tinnitus (<3%)

Respiratory: Dyspnea (<3%), pharyngitis (<3%), rhinitis (<3%)

Miscellaneous: Diaphoresis (3% to 9%), infection (3% to 9%), flu-like syndrome (<3%), hiccups (<3%), thirst (<3%)

<1%, postmarketing, and/or case reports: Abnormal dreams, agitation, allergic reaction, arrhythmia, arthralgia, asthma, bronchitis, chalky stool, clenching teeth, cough, cystitis, depression, dry eyes, dysphagia, esophageal spasm, esophagitis, euphoria, exfoliative dermatitis, gastroenteritis, GI bleeding, GI inflammation, GI perforation, glossitis, glycosuria, hoarseness, hyper/hypotension, impotence, libido decreased, liver enzymes increased, mood changes, myalgia, neuralgia, pneumonia, physical/psychological dependence (with prolonged use), pulmonary congestion, rash, respiratory depression, sinusitis, slurred speech, Stevens-Johnson syndrome, tachycardia, taste (unpleasant), tremor, toxic epidermal necrolysis, ulcer, urinary incontinence, urinary retention, urticaria, vertigo, vision change, weight loss

Metabolism/Transport Effects

Hydrocodone: **Substrate** (minor) of CYP2D6, 3A

Ibuprofen: **Substrate** (minor) of CYP2C9, 2C19; **Inhibits** CYP2C9 (strong)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Based on **hydrocodone** component: Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Based on **ibuprofen** component:

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Ibuprofen peak serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersSigns/symptoms of bleeding; periodic CBC and chemistry profile with long-term use; blood pressure

Nursing: Physical Assessment/MonitoringSee individual agent for Ibuprofen.

Monitoring: Lab TestsPeriodic CBC and chemistry profile with long-term use

Patient EducationSee individual agent for Ibuprofen. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Hydrocodone bitartrate 5 mg and ibuprofen 200 mg; hydrocodone bitartrate 7.5 mg and ibuprofen 200 mg

Ibudone™:

5/200: Hydrocodone bitartrate 5 mg and ibuprofen 200 mg

10/200: Hydrocodone bitartrate 10 mg and ibuprofen 200 mg

Reprexain®: Hydrocodone bitartrate 5 mg and ibuprofen 200 mg; hydrocodone bitartrate 7.5 mg and ibuprofen 200 mg

Vicoprofen®: Hydrocodone bitartrate 7.5 mg and ibuprofen 200 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Hydrocodone-Ibuprofen)

7.5-200 mg (30): $29.99

Tablets (Reprexain)

5-200 mg (30): $39.99

Tablets (Vicoprofen)

7.5-200 mg (30): $74.78

Mechanism of Action

Hydrocodone: Binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression

Ibuprofen: Reversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Ibuprofen: See Ibuprofen monograph.

Hydrocodone:

Onset of action: Narcotic analgesic: 10-20 minutes

Duration: 4-8 hours

Distribution: Crosses placenta

Protein binding: 19% to 45%

Metabolism: Hepatic via CYP2D6 and 3A4; O-demethylation; N-demethylation and 6-ketosteroid reduction

Half-life elimination: 4.5 hours

Time to peak: 1.7 hours

Excretion: Urine

Related Information

- Ibuprofen
- Narcotic / Opioid Analgesics

Pharmacotherapy PearlsThe antipyretic and anti-inflammatory activity of ibuprofen may reduce fever and inflammation, thus diminishing their utility as diagnostic signs in detecting complications of presumed noninfectious, noninflammatory painful conditions.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation, drowsiness, and fatigue are common; may cause nervousness or confusion; may rarely cause hallucinations, depression, or insomnia

Mental Health: Effects on Psychiatric TreatmentHypotension is common and may be potentiated by low potency antipsychotics and other psychotropics. May rarely cause agranulocytosis, caution with clozapine and carbamazepine. Sedation may be additive with psychotropics. Ibuprofen may inhibit the clearance of lithium resulting in elevated serum lithium levels; may need to adjust dosage downward.

Index TermsHydrocodone Bitartrate and Ibuprofen; Ibuprofen and Hydrocodone

Pronunciation(hye droe KOE done & soo doe e FED rin)

U.S. Brand NamesCoughcold HCM [DSC]; P-V Tussin Tablet [DSC]; SymTan™ [DSC]

Pharmacologic CategoryAntitussive/Decongestant

Use: Labeled IndicationsSymptomatic relief of cough and nasal congestion

Dosing: AdultsAntitussive/nasal decongestant: Oral:

Coldcough HCM: 5-10 mL 4 times/day as needed

SymTan™: 5 mL every 12 hours (maximum: 10 mL/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAntitussive/nasal decongestant: Oral:

Children 2-6 years: Coldcough HCM: 1.25-2.5 mL 4 times/day a needed

Children 6-12 years:

Coldcough HCM: 2.5-5 mL 4 times/day as needed

SymTan™: 2.5 mL every 12 hours (maximum: 5 mL/day)

Children >12 years: Refer to adult dosing.

Dietary ConsiderationsSymTan™ solution contains aspartame.

RestrictionsC-III

ContraindicationsHypersensitivity to hydrocodone, pseudoephedrine or any component of the formulation; severe hypertension or coronary artery disease; MAO inhibitor therapy; increased intracranial pressure; depressed ventilatory function; diarrhea associated with pseudomembranous colitis or poisoning; infants; breast-feeding

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Overdosage: May cause hallucinations, seizures, CNS depression, and death with overdosage.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with pulmonary disease or decreased ventilatory function; dose-related respiratory depression occurs.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Safety and efficacy of this combination have not been established in children <2 years of age.

- Postop patients: Use with caution postoperatively; suppresses the cough reflex.

Dosage forms specific issues:

- Aspartame: Some products may contain aspartame.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsHydrocodone and pseudoephedrine are excreted in breast milk. Use of this combination is contraindicated by some manufacturers while breast-feeding. Also refer to Pseudoephedrine monograph.

Metabolism/Transport EffectsHydrocodone: **Substrate** (minor) of CYP2D6, 3A

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Hydrocodone may enhance the CNS depressant effect of alcohol (ethyl).

Nursing: Physical Assessment/MonitoringSee individual agent for Pseudoephedrine.

Patient EducationSee individual agent for Pseudoephedrine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution:

SymTan™: Hydrocodone tannate 10 mg and pseudoephedrine tannate 45 mg per 5 mL (480 mL) [contains aspartame, propylene glycol; cherry mint flavor] [DSC]

Syrup:

Coldcough HCM: Hydrocodone bitartrate 3 mg and pseudoephedrine hydrochloride 15 mg per 5 mL (480 mL) [alcohol, dye and sugar free; contains propylene glycol; grape flavor] [DSC]

Tablet:

P-V Tussin: Hydrocodone bitartrate 5 mg and pseudoephedrine hydrochloride 60 mg [DSC]

Generic AvailableNo

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression.

Pseudoephedrine directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation, increased heart rate and contractility.

Pharmacodynamics/Kinetics

Pseudoephedrine: See Pseudoephedrine monograph.

Hydrocodone:

Onset of action: Narcotic analgesic: 10-20 minutes

Duration: 4-8 hours

Metabolism: Hepatic; O-demethylation; N-demethylation and 6-ketosteroid reduction

Half-life elimination: 3.3-4.4 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause sedation, drowsiness, mental clouding, lethargy, impairment of mental performance, anxiety, fear, dysphoria, dizziness, psychic dependence, mood changes

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors

Index TermsHydrocodone Tannate and Pseudoephedrine Tannate; Pseudoephedrine Hydrochloride and Hydrocodone Bitartrate

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(hye droe KOE done, kar bi NOKS a meen, & soo doe e FED rin)

U.S. Brand NamesTri-Vent™ HC [DSC]

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough, congestion, and rhinorrhea associated with the common cold, influenza, bronchitis, or sinusitis

Dosing: AdultsRelief of cough, congestion, and runny nose: Oral: 5-10 mL every 4-6 hours; maximum dose: 30 mL/24 hours
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRelief of cough, congestion, and runny nose: Oral:

Children *2-10 years:* Dosing based on hydrocodone content: 0.6 mg/kg/day given in 4 divided doses. Alternately, the following dosing may be used based on age:

2-4 years: 1.25 mL every 4-6 hours; maximum dose: 7.5 mL/24 hours

4-10 years: 2.5 mL every 4-6 hours; maximum dose: 15 mL/24 hours

Children >10 years: Refer to adult dosing.

Administration: OralDoses should be administered every 4-6 hours, up to 4 times/day.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).
RestrictionsC-III
ContraindicationsHypersensitivity to hydrocodone, carbinoxamine, pseudoephedrine or any component of the formulation; use with or within 14 days of MAO inhibitors; narrow-angle glaucoma; urinary retention; peptic ulcer; severe hypertension or cardiovascular disease; intracranial lesion associated with elevated intracranial pressure; acute asthmatic attack
Allergy Considerations

- Belladonna Alkaloid Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in patients >60 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination product. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsIt is not known if carbinoxamine is found in breast milk. Hydrocodone and pseudoephedrine are excreted in breast milk. Also refer to the individual Pseudoephedrine and Carbinoxamine monographs.
Adverse ReactionsSee individual agents.
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid or limit ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agent for Pseudoephedrine.

Patient EducationSee individual agent for Pseudoephedrine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Tri-Vent™ HC: Hydrocodone bitartrate 5 mg, carbinoxamine maleate 2 mg, and pseudoephedrine hydrochloride 30 mg per 5 mL (480 mL) [alcohol free, sugar free; peach flavor] [DSC]

Generic AvailableNo

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression.

Carbinoxamine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract.

Pseudoephedrine is a sympathomimetic amine and isomer of ephedrine; acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Carbinoxamine
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, insomnia, restlessness, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment; may cause tremor which may be mistaken for EPS; may cause tachycardia; tachycardia is also common with clozapine; monitor vital signs; may cause sedation (concurrent use with psychotropics may produce additive sedative effects)

Index Terms Carbinoxamine, Pseudoephedrine, and Hydrocodone; Hydrocodone Bitartrate, Carbinoxamine Maleate, and Pseudoephedrine Hydrochloride; Pseudoephedrine, Hydrocodone, and Carbinoxamine

Medication Safety Issues

Sound-alike/look-alike issues:

Endal® may be confused with Depen®, Intal®

Pronunciation(hye droe KOE done, fen il EF rin, & dye fen HYE dra meen)

U.S. Brand NamesD-Tann HC [DSC]; Gentuss-HC; Hydro DP; Rindal HPD [DSC]; TussiNate™ [DSC]

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough and congestion associated with the common cold, sinusitis, or acute upper respiratory tract infections

Dosing: AdultsRelief of cough, congestion: Oral:

D-Tann HC: 5-10 mL every 12 hours

Rindal HPD, TussiNate™: 10 mL every 4 hours (maximum: 40 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRelief of cough, congestion: Oral:

D-Tann HC:

Children 6 to <12 years: 2.5-5 mL every 12 hours

Children ≥12 years: Refer to adult dosing.

Rindal HPD, TussiNate™:

Children 6-12 years: 5 mL every 4 hours (maximum: 20 mL/24 hours)

Children >12 years: Refer to adult dosing.

Dietary Considerations

D-Tann HC contains phenylalanine.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-III

ContraindicationsHypersensitivity to codeine, hydrocodone, phenylephrine, diphenhydramine, sympathomimetic amines, antihistamines, or any component of the formulation; asthma; severe hypertension or cardiovascular disease; use with or within 14 days of an MAO inhibitor; glaucoma; urinary retention; peptic ulcer; breast-feeding; infants

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists.

Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: May produce adverse reactions which may obscure the clinical course of patients with head injuries.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Appropriate use: Do not use with other products containing diphenhydramine, even ones used on the skin.
- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery. Also refer to Diphenhydramine monograph.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIt is not known if phenylephrine is found in breast milk. Hydrocodone and diphenhydramine are excreted in breast milk. Use of this combination is contraindicated by the manufacturers while breast-feeding. Also refer to Diphenhydramine monograph.

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid or limit ethanol (may increase CNS depression).
Nursing: Physical Assessment/MonitoringSee individual agents for Phenylephrine and Diphenhydramine.
Patient EducationSee individual agents for Phenylephrine and Diphenhydramine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension:

D-Tann HC: Hydrocodone tannate 3.5 mg, phenylephrine tannate 7.5 mg, and diphenhydramine tannate 25 mg per 5 mL (120 mL) [alcohol free, sugar free; contains phenylalanine; grape flavor] [DSC]

Syrup:

Gestuss-HC: Hydrocodone bitartrate 3 mg, phenylephrine hydrochloride 5 mg, and diphenhydramine hydrochloride 12.5 mg per 5 mL (480 mL) [black raspberry flavor]

Hydro DP: Hydrocodone bitartrate 2 mg, phenylephrine hydrochloride 7.5 mg, and diphenhydramine hydrochloride 12.5 mg per 5 mL (480 mL) [cherry flavor]

Rindal HPD: Hydrocodone bitartrate 2 mg, phenylephrine hydrochloride 7.5 mg, and diphenhydramine hydrochloride 12.5 mg per 5 mL (480 mL) [alcohol free, sugar free; black raspberry flavor] [DSC]

TussiNate™: Hydrocodone bitartrate 3.5 mg, phenylephrine hydrochloride 5 mg, and diphenhydramine hydrochloride 12.5 mg per 5 mL (480 mL) [alcohol free; contains sodium benzoate; black raspberry flavor] [DSC]

Generic AvailableYes: Syrup
Pricing: U.S. (www.drugstore.com)

Syrup (Hydro-DP)

7.5-12.5-2 mg/5 mL (473): $32.97

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS; suppresses cough in medullary center.

Phenylephrine is a potent, direct-acting alpha-adrenergic stimulator.

Diphenhydramine is an H_1-receptor antagonist.

Pharmacodynamics/KineticsSee individual agents.
Related Information

- DiphenhydrAMINE
- Phenylephrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusDiphenhydramine may cause paradoxical excitation in pediatric patients and can result in hallucinations, coma, and death in overdose. Sedation is common; may cause dizziness, fatigue, nervousness, insomnia, euphoria, or

confusion; may rarely cause hallucinations.

Mental Health: Effects on Psychiatric Treatment Contraindicated with MAO inhibitors. Rare reports of agranulocytosis and thrombocytopenia; use caution with clozapine, carbamazepine, valproic acid, and mirtazapine. Therapeutic effects of cholinergic agents (donepezil, rivastigmine, and galantamine) may be antagonized. Concurrent use with psychotropic agents may result in additive sedative and anticholinergic effects; monitor.

≥12 years: Refer to adult dosing.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-III

ContraindicationsHypersensitivity to hydrocodone, phenylephrine, guaifenesin, or any component of the formulation; severe hypertension, severe cardiac disease; use with or within 14 days of MAO inhibitors; urinary retention; peptic ulcer

Allergy Considerations

- GuaiFENesin Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Use with caution in children; may be more sensitive to adverse effects.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Geriatric ConsiderationsElderly may be particularly susceptible to CNS depression and confusion, as well as the constipating effects of narcotics. Elderly are more predisposed to adverse effects of sympathomimetics since they frequently have cardiovascular disease and diabetes, as well as multiple drug therapies.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsHydrocodone is excreted in breast milk; information for guaifenesin and phenylephrine is not available.
Adverse ReactionsFrequency not defined.

Central nervous system: Drowsiness, giddiness, lassitude

Gastrointestinal: Constipation, GI upset, nausea

Metabolism/Transport EffectsHydrocodone: **Substrate** (minor) of CYP2D6, 3A
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Liquid:

Crantex HC: Hydrocodone bitartrate 5 mg, phenylephrine hydrochloride 7.5 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; black cherry flavor] [DSC]

De-Chlor G: Hydrocodone bitartrate 2 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 100 mg per 5 mL (480 mL) [grape-menthol mint flavor] [DSC]

ExeTuss HC: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 225 mg per 5 mL (480 mL) [alcohol free, sugar free; cherry flavor] [DSC]

Gentex HC: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 7.5 mg, and guaifenesin 100 mg per 5 mL (480 mL) [cherry flavor] [DSC]

Giltuss HC®: Hydrocodone bitartrate 5 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 300 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; strawberry banana flavor] [DSC]

Guiaplex™ HC: Hydrocodone bitartrate 5 mg, phenylephrine hydrochloride 15 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate; grape flavor] [DSC]

Hydro-GP: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 7.5 mg, and guaifenesin 50 mg per 5 mL (480 mL) [cherry flavor] [DSC]

Levall 5.0: Hydrocodone bitartrate 5 mg, phenylephrine hydrochloride 15 mg, and guaifenesin 100 mg per 5 mL (480 mL) [grape flavor] [DSC]

Mintuss G: Hydrocodone bitartrate 2 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free; contains sodium benzoate; grape flavor] [DSC]

Syrup:

Donatussin DC: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 6 mg, and guaifenesin 120 mg per 5 mL (480 mL) [cherry flavor] [DSC]

HydroFed: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 6 mg, and guaifenesin 150 mg per 5 mL (480 mL) [alcohol free, sugar free; contains propylene glycol; cherry flavor] [DSC]

Tussafed® HC: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 7.5 mg, and guaifenesin 50 mg per 5 mL (480 mL) [alcohol free] [DSC]

Tussafed® HCG: Hydrocodone bitartrate 2.5 mg, phenylephrine hydrochloride 6 mg, and guaifenesin 150 mg per 5 mL (480 mL) [alcohol free, sugar free; cherry flavor] [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Tussafed HC)

7.5-2.5-50 mg/5 mL (473): $133.10

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression.

Phenylephrine is a direct-acting alpha-adrenergic stimulator with weak beta-adrenergic activity; causes vasoconstriction of the arterioles of the nasal mucosa and conjunctiva; activates the dilator muscle of the pupil to cause contraction; produces vasoconstriction of arterioles in the body; produces systemic arterial vasoconstriction.

Guaifenesin is thought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tachycardia, palpitations, and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness and giddiness are common; may cause CNS depression; concomitant use with psychotropic agents may produce additive effects

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor use; CNS depressants, MAO inhibitors, and tricyclic antidepressants may potentiate the effects of opiate agonists. Dextroamphetamine may enhance the analgesic effect of opiate agonists. Chlorpromazine, fluoxetine, paroxetine, pergolide, and ropinirole may decrease the effects of hydrocodone.

Index TermsGuaifenesin, Hydrocodone Bitartrate, and Phenylephrine Hydrochloride; Phenylephrine, Guaifenesin, and Hydrocodone

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(hye droe KOE done, soo doe e FED rin & gwye FEN e sin)

U.S. Brand NamesEntex® HC [DSC]; Hydro-Tussin™ HD [DSC]; Hydro-Tussin™ XP [DSC]; Su-Tuss®-HD [DSC]; Ztuss™ Tablet [DSC]

Pharmacologic CategoryAntitussive/Decongestant/Expectorant

Use: Labeled IndicationsSymptomatic relief of irritating, nonproductive cough associated with upper respiratory conditions and allergies

Dosing: Adults**Cough/congestion:** Oral:

Hydro-Tussin™ XP: 5-10 mL 4 times/day as needed

Hydro-Tussin™ HD: 10 mL every 4-6 hours as needed

Ztuss™: 1-1$^{1}/_{2}$ tablets every 4-6 hours (maximum: 8 tablets/24 hours)

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Cough/congestion:** Oral: Children:

2-6 years: Hydro-Tussin™ XP: 1.25-2.5 mL 4 times/day as needed

6-12 years:

Hydro-Tussin™ XP: 2.5-5 mL 4 times/day as needed

Hydro-Tussin™ HD: 5 mL every 4-6 hours as needed

Ztuss™: One-half to 1 tablet every 4-6 hours (maximum: 6 tablets/24 hours)

≥12 years: Refer to adult dosing.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
RestrictionsC-III
ContraindicationsHypersensitivity to hydrocodone, pseudoephedrine, guaifenesin, or any component of the formulation; severe hypertension; severe cardiac disease; use with or within 14 days of MAO inhibitors; increased intracranial pressure; pregnancy; breast-feeding
Allergy Considerations

- GuaiFENesin Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Use with caution in children; may be more sensitive to adverse effects.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery. Use during

pregnancy is contraindicated by some manufacturers.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsHydrocodone and pseudoephedrine are excreted in breast milk; information for guaifenesin is not available. Use while breast-feeding is contraindicated by some manufacturers. Also refer to Pseudoephedrine monograph.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, tachycardia, hypertension

Central nervous system: Drowsiness, fear, anxiety, tenseness, restlessness, pallor, insomnia, hallucinations, CNS depression

Gastrointestinal: GI upset, nausea, constipation with prolonged use

Genitourinary: Dysuria

Hepatic: Transaminases increased (slight)

Neuromuscular & skeletal: Weakness, tremor

Respiratory: Respiratory difficulty

Patients hyper-reactive to pseudoephedrine may display ephedrine-like reactions such as tachycardia, palpitation, headache, dizziness, or nausea; patient idiosyncrasy to adrenergic agents may be manifested by insomnia, dizziness, weakness, tremor, or arrhythmia.

Metabolism/Transport EffectsHydrocodone: **Substrate** (minor) of CYP2D6, 3A

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsRefer to individual monographs for Pseudoephedrine and Guaifenesin.

Nursing: Physical Assessment/MonitoringSee individual agents for Pseudoephedrine and Guaifenesin.

Patient EducationSee individual agents for Pseudoephedrine and Guaifenesin. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir:

Su-Tuss®-HD: Hydrocodone bitartrate 2.5 mg, pseudoephedrine hydrochloride 30 mg, and guaifenesin 100 mg per 5 mL (480 mL) [contains alcohol; fruit punch flavor] [DSC]

Liquid:

Entex® HC: Hydrocodone bitartrate 3.75 mg, pseudoephedrine hydrochloride 22.5 mg, and guaifenesin 50 mg per 5 mL (480 mL) [alcohol free, sugar free; contains propylene glycol; tropical fruit punch flavor] [DSC]

Hydro-Tussin™ HD: Hydrocodone bitartrate 2.5 mg, pseudoephedrine hydrochloride 30 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free; contains sodium benzoate] [DSC]

Hydro-Tussin® XP: Hydrocodone bitartrate 3 mg, pseudoephedrine hydrochloride 15 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free, dye free] [DSC]

Tablet:

Ztuss™: Hydrocodone bitartrate 5 mg, pseudoephedrine hydrochloride 30 mg, and guaifenesin 300 mg [sugar free] [DSC]

Generic AvailableYes: Excludes tablet

Elixir (Drituss HD)

30-2.5-100 mg/5 mL (120): $16.00

Solution (Tussend Expectorant)

30-2.5-100 mg/5 mL (120): $23.99

Mechanism of Action

Hydrocodone binds to opiate receptors in the CNS, altering the perception of and response to pain; suppresses cough in medullary center; produces generalized CNS depression.

Pseudoephedrine directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation, increased heart rate and contractility.

Guaifenesin is thought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity.

Pharmacodynamics/Kinetics

See Guaifenesin and Pseudoephedrine monographs.

Hydrocodone:

Onset of action: Narcotic analgesic: 10-20 minutes

Duration: 4-8 hours

Distribution: Crosses placenta

Metabolism: Hepatic; O-demethylation; N-demethylation and 6-ketosteroid reduction

Half-life elimination: 3.3-4.4 hours

Excretion: Urine

Pharmacologic CategoryCorticosteroid, Rectal; Corticosteroid, Systemic; Corticosteroid, Topical

Use: Labeled IndicationsManagement of adrenocortical insufficiency; relief of inflammation of corticosteroid-responsive dermatoses (low and medium potency topical corticosteroid); adjunctive treatment of ulcerative colitis

Use: Unlabeled/InvestigationalManagement of septic shock when blood pressure is poorly responsive to fluid resuscitation and vasopressor therapy

Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory, or autoimmune origin

Dosing: AdultsDose should be based on severity of disease and patient response.

Adrenal hyperplasia (congenital): Oral: Initial: 10-20 mg/m^2/day in 3 divided doses; a variety of dosing schedules have been used. **Note:** Inconsistencies have occurred with liquid formulations; tablets may provide more reliable levels. Doses must be individualized by monitoring growth, bone age, and hormonal levels. Mineralocorticoid and sodium supplementation may be required based upon electrolyte regulation and plasma renin activity.

Adrenal insufficiency (acute): I.M., I.V.: Succinate: 100 mg I.V. bolus, then 300 mg/day in divided doses every 8 hours or as a continuous infusion for 48 hours. Once patient is stable change to oral, 50 mg every 8 hours for 6 doses, then taper to 30-50 mg/day in divided doses.

Adrenal insufficiency (chronic)/physiologic replacement: Oral: 20-30 mg/day

Anti-inflammatory or immunosuppressive: Oral, I.M., I.V.: Succinate: 15-240 mg every 12 hours

Dermatosis: Topical: Apply to affected area 2-4 times/day.

Septic shock (unlabeled use): I.V.: 50 mg every 6 hours (or 200-300 mg total daily dose) (Marik, 2008). Taper slowly (for total of 11 days) and do not stop abruptly. **Note:** Fludrocortisone is optional with use of hydrocortisone.

Shock: I.M., I.V.: Succinate: 500 mg to 2 g every 2-6 hours

Status asthmaticus: I.V.: Succinate: 1-2 mg/kg/dose every 6 hours for 24 hours, then maintenance of 0.5-1 mg/kg every 6 hours

Stress dosing (surgery) in patients known to be adrenally-suppressed or on chronic systemic steroids: I.V.:

Minor stress (ie, inguinal herniorrhaphy): 25 mg/day for 1 day

Moderate stress (ie, joint replacement, cholecystectomy): 50-75 mg/day (25 mg every 8-12 hours) for 1-2 days

Major stress (pancreatoduodenectomy, esophagogastrectomy, cardiac surgery): 100-150 mg/day (50 mg every 8-12 hours) for 2-3 days

Rheumatic diseases:

Intralesional, intra-articular, soft tissue injection: Acetate:

Large joints: 25 mg (up to 37.5 mg)

Small joints: 10-25 mg

Tendon sheaths: 5-12.5 mg

Soft tissue infiltration: 25-50 mg (up to 75 mg)

Bursae: 25-37.5 mg

Ganglia: 12.5-25 mg

Ulcerative colitis: Rectal: 10-100 mg 1-2 times/day for 2-3 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDose should be based on severity of disease and patient response.

Adrenal hyperplasia (congenital): Oral: Initial: 10-20 mg/m^2/day in 3 divided doses; a variety of dosing schedules have been used. **Note:** Inconsistencies have occurred with liquid formulations; tablets may provide more reliable levels. Doses must be individualized by monitoring growth, bone age, and hormonal levels. Mineralocorticoid and sodium supplementation may be required based upon electrolyte regulation and plasma renin activity

Adrenal insufficiency (acute): I.M., I.V.:

Infants and young Children: Succinate: 1-2 mg/kg/dose bolus, then 25-150 mg/day in divided doses every 6-8 hours

Older Children: Succinate: 1-2 mg/kg bolus then 150-250 mg/day in divided doses every 6-8 hours

Anti-inflammatory or immunosuppressive:

Infants and Children:

Oral: 2.5-10 mg/kg/day **or** 75-300 mg/m^2/day every 6-8 hours

I.M., I.V.: Succinate: 1-5 mg/kg/day **or** 30-150 mg/m^2/day divided every 12-24 hours

Adolescents: Oral, I.M., I.V.: Succinate: 15-240 mg every 12 hours

Physiologic replacement: Children:

Oral: 0.5-0.75 mg/kg/day **or** 20-25 mg/m^2/day every 8 hours

I.M.: Succinate: 0.25-0.35 mg/kg/day **or** 12-15 mg/m^2/day once daily

Shock: I.M., I.V.: Succinate:

Children: Initial: 50 mg/kg, then repeated in 4 hours and/or every 24 hours as needed

Adolescents: 500 mg to 2 g every 2-6 hours

Status asthmaticus: Children: I.V.: Succinate: 1-2 mg/kg/dose every 6 hours for 24 hours, then maintenance of 0.5-1 mg/kg every 6 hours.

Dermatosis: Topical: Children >2 years: Apply to affected area 2-4 times/day (Buteprate: Apply once or twice daily).

Dosing: Combination Regimens

Prostate cancer:

Estramustine + Docetaxel + Hydrocortisone

Mitoxantrone + Hydrocortisone

Calculations

- Corticosteroid Conversion

Administration: I.V.

Parenteral: Hydrocortisone sodium succinate may be administered by I.M. or I.V. routes.

I.V. bolus: Dilute to 50 mg/mL and administer over 30 seconds or over 10 minutes for doses ≥500 mg

I.V. intermittent infusion: Dilute to 1 mg/mL and give over 20-30 minutes.

Note: Should be administered in a 0.1-1 mg/mL concentration due to stability problems.

Administration: I.V. Detail

pH: Hydrocortisone sodium succinate: 7-8

Administration: OralAdminister with food or milk to decrease GI upset.
Administration: TopicalApply a thin film sparingly to clean, dry skin and rub in gently.
Dietary ConsiderationsSystemic use of corticosteroids may require a diet with increased potassium, vitamins A, B_6, C, D, folate, calcium, zinc, phosphorus, and decreased sodium. Sodium content of 1 g (sodium succinate injection): 47.5 mg (2.07 mEq)
StorageStore at controlled room temperature 20°C to 25°C (68°F to 77°F). Protect from light. Hydrocortisone sodium phosphate and hydrocortisone sodium succinate are clear, light yellow solutions which are heat labile.

Sodium succinate: After initial reconstitution, hydrocortisone sodium succinate solutions are stable for 3 days at room temperature or under refrigeration when protected from light. Stability of parenteral admixture (Solu-Cortef®) at room temperature (25°C) and at refrigeration temperature (4°C) is concentration-dependent:

Stability of concentration 1 mg/mL: 24 hours.

Stability of concentration 2 mg/mL to 60 mg/mL: At least 4 hours.

Reconstitution

Sodium succinate: Reconstitute 100 mg vials with bacteriostatic water (not >2 mL). Act-O-Vial (self-contained powder for injection plus diluent) may be reconstituted by pressing the activator to force diluent into the powder compartment. Following gentle agitation, solution may be withdrawn via syringe through a needle inserted into the center of the stopper. May be administered (I.V. or I.M.) without further dilution.

Solutions for I.V. infusion: Reconstituted solutions may be added to an appropriate volume of compatible solution for infusion. Concentration should generally not exceed 1 mg/mL. However, in cases where administration of a small volume of fluid is desirable, 100-3000 mg may be added to 50 mL of D_5W or NS (stability limited to 4 hours).

Compatibility

Hydrocortisone sodium phosphate: Stable in D_5W, NS, fat emulsion 10%.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cladribine, clarithromycin, docetaxel, etoposide, famotidine, filgrastim, fluconazole, fludarabine, gemcitabine, granisetron, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, teniposide, thiotepa, vinorelbine. **Incompatible:** Sargramostim.

Compatibility in syringe: Compatible: Metoclopramide. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Amikacin, amphotericin B, amphotericin B with heparin, bleomycin, dacarbazine, metaraminol, sodium bicarbonate, verapamil. **Variable (consult detailed reference):** Mitoxantrone.

Hydrocortisone sodium succinate: Stable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, $D_{20}W$, LR, ${}^1/_2NS$, NS, fat emulsion 10%.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, aminophylline, amphotericin B cholesteryl sulfate complex, ampicillin, amsacrine, argatroban, atracurium, atropine, aztreonam, betamethasone sodium phosphate, bivalirudin, calcium gluconate, cefepime, chlordiazepoxide, chlorpromazine, cisatracurium, cladribine, cyanocobalamin, cytarabine, dexamethasone sodium phosphate, digoxin, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, droperidol, droperidol and fentanyl, edrophonium, enalaprilat, epinephrine, esmolol, estrogens (conjugated), ethacrynate sodium, etoposide, famotidine, fentanyl, filgrastim, fludarabine, fluorouracil, foscarnet, furosemide, gatifloxacin, gemcitabine, granisetron, heparin, hydralazine, inamrinone, insulin (regular), isoproterenol, kanamycin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, menadiol sodium diphosphate, meperidine, methoxamine, methylergonovine, minocycline, morphine, neostigmine, nicardipine, norepinephrine, ondansetron, oxacillin, oxytocin, paclitaxel, pancuronium, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine edisylate, propofol, propranolol, pyridostigmine, remifentanil, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethaphan camsylate, trimethobenzamide, vecuronium, vinorelbine. **Incompatible:** Ciprofloxacin, diazepam, ergotamine, idarubicin, midazolam, phenytoin, sargramostim. **Variable (consult detailed reference):** Diltiazem, methylprednisolone sodium succinate, promethazine.

Compatibility in syringe: Compatible: Diatrizoate meglumine 52%, diatrizoate sodium 8%, diatrizoate sodium 60%, iohexol, iopamidol, iothalamate meglumine 60%, ioxaglate meglumine 39.3%, ioxaglate sodium 19.6%, metoclopramide, thiopental. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Amikacin, aminophylline, amphotericin B, calcium chloride, calcium gluconate, chloramphenicol, clindamycin, corticotropin, daunorubicin, diphenhydramine, dopamine, erythromycin lactobionate, floxacillin, lidocaine, magnesium sulfate, mephentermine, metronidazole, metronidazole with sodium bicarbonate, mitomycin, mitoxantrone, norepinephrine, penicillin G potassium, penicillin G sodium, piperacillin, polymyxin B sulfate, potassium chloride, procaine, sodium bicarbonate, theophylline, thiopental, vancomycin, verapamil, vitamin B complex with C. **Incompatible:** Aminophylline with cephalothin, bleomycin, colistimethate, ephedrine, hydralazine, nafcillin, pentobarbital, phenobarbital, prochlorperazine edisylate, promethazine. **Variable (consult detailed reference):** Amobarbital, ampicillin, cytarabine, dimenhydrinate, furosemide, heparin, kanamycin, metaraminol.

ContraindicationsHypersensitivity to hydrocortisone or any component of the formulation; serious infections, except septic shock or tuberculous meningitis; viral, fungal, or tubercular skin lesions; I.M. administration contraindicated in idiopathic thrombocytopenia purpura

Rectal suspension: Systemic fungal infections; ileocolostomy during the immediate or early postoperative period

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF or hypertension; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Head injury: Increased mortality was observed in patients receiving high-dose I.V. methylprednisolone; high-dose corticosteroids should not be used for the management of head injury.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients.

Dosage form specific issues:

- Topical preparations: Avoid use of topical preparations with occlusive dressings or on weeping or exudative lesions.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Hydrocortisone crosses the placenta. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Topical products are not recommended for extensive use, in large quantities, or for long periods of time in pregnant women.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsCorticosteroids are excreted in breast milk and endogenous hydrocortisone is also found in human milk; the effect of maternal hydrocortisone intake is not known.

Adverse Reactions

Systemic:

Frequency not defined:

Cardiovascular: Edema, hypertension

Central nervous system: Delirium, euphoria, hallucinations, headache, insomnia, nervousness, pseudotumor cerebri, psychoses, seizure, vertigo

Dermatologic: Bruising, hyperpigmentation, skin atrophy

Endocrine & metabolic: Adrenal suppression, alkalosis, amenorrhea, Cushing's syndrome, diabetes mellitus, glucose intolerance, growth suppression, hyperglycemia, hyperlipidemia, hypokalemia, pituitary-adrenal axis suppression, sodium and water retention

Gastrointestinal: Abdominal distention, appetite increased, indigestion, nausea, pancreatitis, peptic ulcer, ulcerative esophagitis, vomiting

Hematologic: Leukocytosis (transient)

Neuromuscular & skeletal: Arthralgia, fractures, muscle weakness, osteoporosis

Ocular: Cataracts, glaucoma

Miscellaneous: Avascular necrosis, hypersensitivity reactions, infection, secondary malignancy

Topical:

>10%: Dermatologic: Eczema (12.5%)

1% to 10%: Dermatologic: Pruritus (6%), stinging (2%), dry skin (2%)

<1%: Allergic contact dermatitis, burning, dermal atrophy, folliculitis, HPA axis suppression, hypopigmentation; metabolic effects (hyperglycemia, hypokalemia); striae

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Hydrocortisone interferes with calcium absorption.

Herb/Nutraceutical: St John's wort may decrease hydrocortisone levels. Avoid cat's claw, echinacea (have immunostimulant properties).

Monitoring ParametersBlood pressure, weight, serum glucose, and electrolytes

Reference RangeTherapeutic: AM: 5-25 mcg/dL (SI: 138-690 nmol/L), PM: 2-9 mcg/dL (SI: 55-248 nmol/L) depending on test, assay

Nursing: Physical Assessment/MonitoringMonitor laboratory results, effects and interactions of other medications patient may be taking, response to therapy and adverse effects according to diagnosis, formulation of hydrocortisone, dosage, and extent of time used. Systemic administration and long-term use will require close and frequent monitoring, especially for Cushing's syndrome. Assess for signs of fluid retention. Taper dosage when discontinuing. Assess/teach patient appropriate use, interventions for possible adverse reactions, and symptoms to report. Topical absorption may be minimal.

Monitoring: Lab TestsSerum glucose, electrolytes

Patient EducationSystemic: Take as directed; do not increase doses and do not stop abruptly without consulting prescribed. Dosage of systemic hydrocortisone is usually tapered off gradually. Take oral dose with food to reduce GI upset. Avoid alcohol. Hydrocortisone may cause immunosuppression and mask symptoms of infection; avoid exposure to contagion and notify prescriber of any signs of infection (eg, fever, chills, sore throat, injury) and notify dentist or surgeon (if necessary) that you are taking this medication. You may experience increased appetite, indigestion, or increased nervousness. Report any sudden weight gain (>5 lb/week), swelling of extremities or respiratory difficulty, abdominal pain, severe vomiting, black or tarry stools, fatigue, anorexia, weakness, or unusual mood swings. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Topical: Before applying, wash area gently and thoroughly. Apply a thin film to cleansed area and rub in gently until medication vanishes. Avoid use of occlusive dressings over topical application unless directed by a prescriber. Avoid use on weeping or exudative lesions. Avoid exposing affected area to sunlight; you will be more sensitive and severe sunburn may occur. Consult prescriber if breast-feeding.

Rectal: Gently insert suppository as high as possible with gloved finger while lying down. Avoid injury with long or sharp fingernails. Remain in resting position for 10 minutes after insertion.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, rectal, as acetate (Cortifoam®): 10% (15 g) [90 mg/applicator]

Cream, rectal, as acetate (Nupercainal® Hydrocortisone Cream): 1% (30 g) [strength expressed as base]

Cream, rectal, as base:

Cortizone®-10: 1% (30 g) [contains aloe]

Preparation H® Hydrocortisone: 1% (27 g)

Cream, topical, as acetate: 0.5% (9 g, 30 g, 60 g) [available with aloe]; 1% (30 g, 454 g) [available with aloe]

Cream, topical, as base: 0.5% (30 g); 1% (1.5 g, 30 g, 114 g, 454 g); 2.5% (20 g, 30 g, 454 g)

Anusol-HC®: 2.5% (30 g) [contains benzyl alcohol]

Caldecort®: 1% (30 g) [contains aloe vera gel]

Cortaid® Intensive Therapy: 1% (60 g)

Cortaid® Maximum Strength: 1% (15 g, 30 g, 40 g, 60 g) [contains aloe vera gel and benzyl alcohol]

Cortaid® Sensitive Skin: 0.5% (15 g) [contains aloe vera gel]

Cortizone®-10 Maximum Strength: 1% (15 g, 30 g, 60 g) [contains aloe]

Cortizone®-10 Plus Maximum Strength: 1% (30 g, 60 g) [contains vitamins A, D, E and aloe]

Dermarest® Dricort®: 1% (15 g, 30 g)

HydroZone Plus, Proctocort®, Procto-Pak™: 1% (30 g)

Hytone®: 2.5% (30 g, 60 g)

IvySoothe®: 1% (30 g) [contains aloe]

Post Peel Healing Balm: 1% (23 g)

ProctoCream® HC: 2.5% (30 g) [contains benzyl alcohol]

Procto-Kit™: 1% (30 g) [packaged with applicator tips and finger cots]; 2.5% (30 g) [packaged with applicator tips and finger cots]

Proctosol-HC®, Proctozone-HC™: 2.5% (30 g)

Summer's Eve® SpecialCare™ Medicated Anti-Itch Cream: 1% (30 g) [DSC]

Cream, topical, as butyrate (Locoid®, Locoid Lipocream®): 0.1% (15 g, 45 g)

Cream, topical, as probutate (Pandel®): 0.1% (15 g, 45 g, 80 g)

Cream, topical, as valerate (Westcort®): 0.2% (15 g, 45 g, 60 g)

Gel, topical, as base (Corticool®): 1% (45 g)

Injection, powder for reconstitution, as sodium succinate:

A-Hydrocort®: 100 mg [contains monobasic sodium phosphate 0.8 mg, anhydrous dibasic sodium phosphate 8.73 mg; strength expressed as base]

Solu-Cortef®: 100 mg, 250 mg, 500 mg, 1 g [diluent contains benzyl alcohol; strength expressed as base]

Lotion, topical, as base: 1% (120 mL); 2.5% (60 mL)

Aquanil™ HC: 1% (120 mL)

Beta-HC®, Cetacort® [DSC], Sarnol®-HC: 1% (60 mL)

HydroZone Plus: 1% (120 mL)

Hytone®: 2.5% (60 mL)

Nutracort®: 1% (60 mL, 120 mL); 2.5% (60 mL, 120 mL)

Lotion, topical, as butyrate:

Locoid®: 0.1% (60 mL)

Ointment, topical, as acetate: 1% (30 g) [strength expressed as base; available with aloe]

Anusol® HC-1: 1% (21 g) [strength expressed as base]

Cortaid® Maximum Strength: 1% (15 g, 30 g) [strength expressed as base]

Ointment, topical, as base: 0.5% (30 g); 1% (30 g, 454 g); 2.5% (20 g, 30 g, 454 g)

Cortizone®-10 Maximum Strength: 1% (30 g, 60 g)

Hytone®: 2.5% (30 g) [DSC]

Ointment, topical, as butyrate (Locoid®): 0.1% (15 g, 45 g)

Ointment, topical, as valerate (Westcort®): 0.2% (15 g, 45 g, 60 g)

Powder, for prescription compounding [micronized]:

Hydro-Rx: USP (10 g, 25 g, 50 g, 100 g)

Powder, for prescription compounding, as acetate [micronized]: USP (10 g, 25 g, 50 g)

Solution, otic, as base (EarSol® HC): 1% (30 mL) [contains alcohol 44%, benzyl benzoate, yerba santa]

Solution, topical, as base (Texacort®): 2.5% (30 mL) [contains ethanol 48%]

Solution, topical, as butyrate (Locoid®): 0.1% (20 mL, 60 mL) [contains alcohol 50%]

Solution, topical spray, as base:

Cortaid® Intensive Therapy: 1% (60 mL) [contains alcohol]

Cortizone®-10 Quick Shot: 1% (44 mL) [contains benzyl alcohol]

Dermtex® HC: 1% (52 mL) [contains menthol 1%]

Suppository, rectal, as acetate: 25 mg (12s, 24s, 100s)

Anucort-HC®, Tucks® Anti-Itch: 25 mg (12s, 24s, 100s) [strength expressed as base; Anucort-HC® *renamed* Tucks® Anti-Itch]

Anusol-HC®, Proctosol-HC®: 25 mg (12s, 24s)

Encort™, Proctocort®: 30 mg (12s)

Hemril®-30, Proctosert: 30 mg (12s, 24s)

Suspension, rectal, as base: 100 mg/60 mL (7s)

Colocort®, Cortenema®: 100 mg/60 mL (1s, 7s)

Tablet, as base: 20 mg

Cortef®: 5 mg, 10 mg, 20 mg

Generic AvailableYes: Excludes acetate foam, butyrate cream and ointment, gel as base, otic drops as base, probutate cream, sodium succinate injection

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability

Pharmacodynamics/Kinetics

Onset of action:

Hydrocortisone acetate: Slow

Hydrocortisone sodium succinate (water soluble): Rapid

Duration: Hydrocortisone acetate: Long

Absorption: Rapid by all routes, except rectally

Metabolism: Hepatic

Half-life elimination: Biologic: 8-12 hours

Excretion: Urine (primarily as 17-hydroxysteroids and 17-ketosteroids)

Related Information

- Corticosteroids
- Management of Drug Extravasations

Pharmacotherapy PearlsHydrocortisone base topical cream, lotion, and ointments in concentrations of 0.25%, 0.5%, and 1% may be OTC or prescription depending on the product labeling.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia and nervousness are common; rare reports of delirium, euphoria, hallucinations, and mood swings

Mental Health: Effects on Psychiatric TreatmentBarbiturates may increase the metabolism of hydrocortisone; lithium has been used to treat mood swings associated with hydrocortisone

Cardiovascular ConsiderationsLong-term steroid therapy is associated with a fluid retention and hypertension. Glucocorticoid agents have some mineralocorticoid activity with consequent hemodynamic effects. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Oral and intravenous steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Although glucocorticoids can provide relief from pericarditis postmyocardial infarctions, these drugs may cause thinning of the developing scar and myocardial rupture.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Hydrocortisone is a long-acting corticosteroid with minimal sodium-retaining potential.

Evidence-Based Information:

Neuromuscular Effects: ICU-acquired paresis was recently studied in 5 ICUs (3 medical and 2 surgical ICUs) at 4 French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (De Jonghe, 2002). Each patient had to be mechanically ventilated for ≥7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluated, about 25% developed ICU-acquired paresis. Independent predictors included: female gender, the number of days with ≥2 organ dysfunction, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appears to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible.

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (eg, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures have been published (Coursin, 2002; Salem, 1994).

Septic Shock: Annane, et al (2002) randomized 300 septic shock patients to either hydrocortisone (50 mg I.V. push every 6 hours) and fludrocortisone (50 mcg tablet daily via nasogastric tube) or matching placebos for 7 days. The mean Simplified Acute Physiology Score II (SAPS II) was 57 ± 19 in the placebo group and 60 ± 19 in the active treatment group. The Logistic Organ Dysfunction score was 9 ± 3 in the placebo group and 9 ± 3 in the active treatment group. In patients who did not appropriately respond to corticotropin (nonresponders), there were significantly fewer deaths in the active treatment group. Vasopressor therapy was withdrawn more frequently in this subset of the active treatment group. Adverse events were similar in both groups.

In the CORTICUS trial (Sprung, 2008), 484 septic shock patients were randomized within 72 hours of onset to receive either hydrocortisone (50 mg I.V. push every 6 hours) or placebo for 5 days followed by a 6-day taper. The primary endpoint was 28 day mortality in patients who did not respond to corticotropin. The SAPS II score in the treatment group was 49.5 ± 17.8 and 48.6 ± 16.7 in the placebo group. The Sequential Organ Failure Assessment scores were 10.6 ± 3.4 in the treatment group and 10.6 ± 3.2 in the placebo group. Different than the Annane study, in the patients who did not respond to corticotropin, there was no mortality difference at 28 days; 39.2% (95% CI: 30.5-47.9) mortality in the hydrocortisone group and 36.1 % (95% CI: 26.9-45.3, P=0.69) mortality in the placebo group. A trend towards increased incidence of superinfection was noted in hydrocortisone patients. New septic shock episodes, hyperglycemia, and hypernatremia were more frequent in the hydrocortisone group. Hydrocortisone did not improve survival in this population of septic shock patients regardless of corticotropin response.

The 2008 Surviving Sepsis Campaign Guidelines suggest the following: Intravenous hydrocortisone be given only to adult septic shock patients after blood pressure is identified to be poorly responsive to fluid resuscitation and vasopressor therapy (Grade 2C); ACTH stimulation test not be used to identify the subset of adults with septic shock who should receive hydrocortisone (Grade 2B); patients with septic shock should not receive dexamethasone if hydrocortisone is available (Grade 2B); the addition of fludrocortisone if hydrocortisone is not available and the steroid that is substituted does not have significant mineralocorticoid activity (Grade 2C); doses of corticosteroids comparable to >300 mg hydrocortisone daily not be used in severe sepsis or septic shock for the purpose of treating septic shock (Grade 1A). They also recommend corticosteroids not be administered for the treatment of sepsis in the absence of shock. There is, however, no contraindication to continuing maintenance steroid therapy or to using stress dose steroids if the patient's endocrine or corticosteroid administration history warrants (Grade 1D).

The 2008 Recommendations for the diagnosis and management of corticosteroid insufficiency in critically ill adult patients suggest a diagnosis of critical illness related corticosteroid insufficiency can be made by a delta cortisol level (after 250 mcg cosyntropin) of <9 mcg/dL or a random cortisol <10 mcg/dL (Grade 2B). However, they recommend **against** the use of ACTH stimulation test to determine if septic shock or ARDS patients should receive steroid therapy (Grade 2B). They recommend to consider using hydrocortisone in septic shock patients who have responded poorly to resuscitation and vasopressors (Grade 2B) and glucocorticoid treatment should be tapered slowly and not stopped abruptly (Grade 2B). Dexamethasone is **not** recommended for the treatment of septic shock or ARDS (Grade 1B). Fludrocortisone therapy is considered optional (Grade 2B).

Hydroflumethiazide and Reserpine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(hye droe floo meth EYE a zide & re SER peen)

Canadian Brand NamesSalutensin®

Pharmacologic CategoryCentral Monoamine-Depleting Agent; Diuretic, Thiazide

Use: Labeled IndicationsManagement of hypertension

Dosing: AdultsHypertension: Oral: 1 tablet once or twice daily (as determined by individual titration)

Dosing: ElderlyRefer to adult dosing.

RestrictionsNot available in U.S.

Contraindications

Based on **hydroflumethiazide** component: Hypersensitivity to hydroflumethiazide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation

Based on **reserpine** component: Hypersensitivity to reserpine or any component of the formulation; active peptic ulcer disease, ulcerative colitis, history of mental depression (especially with suicidal tendencies); MAO inhibitors

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: With high doses of reserpine, significant mental depression, anxiety, or psychosis may occur (uncommon at dosages <0.25 mg/day).
- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur with hydroflumethiazide.
- Orthostatic hypotension: Reserpine may cause orthostatic hypotension; use with caution in patients at risk of hypotension or in patients where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease).
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Asthma: Use reserpine with caution in patients with asthma.
- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gallstones: Use reserpine with caution in patients with gallstones.
- Gastrointestinal disease: Use reserpine with caution in patients with inflammatory bowel disease or history of peptic ulcer disease.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydroflumethiazide.
- Hepatic impairment: Use hydroflumethiazide with caution in patients with severe hepatic dysfunction. In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypokalemia: Use hydroflumethiazide with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Use reserpine with caution in patients with impaired renal function; avoid hydroflumethiazide in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Hydroflumethiazide can cause SLE exacerbation or activation.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Electroshock therapy: Discontinue reserpine 7 days before electroshock therapy.

Pregnancy Risk FactorC

Adverse ReactionsSee individual agents.

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amphetamines: Gastrointestinal Acidifying Agents may decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Beta-Blockers: Reserpine may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Reserpine may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

MAO Inhibitors: May enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Tetrabenazine: Reserpine may enhance the adverse/toxic effect of Tetrabenazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Salutensin®: Hydroflumethiazide 50 mg and reserpine 0.125 mg

Salutensin-Demi®: Hydroflumethiazide 25 mg and reserpine 0.125 mg

Generic AvailableYes

Pharmacodynamics/KineticsSee individual agents.

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, nightmares, nervousness, drowsiness, fatigue, mental depression, parkinsonism, dull sensorium, syncope, paradoxical anxiety

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity, monitor serum lithium levels; contraindicated in those with depression or undergoing ECT; avoid concurrent use with MAO inhibitors

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for hydroflumethiazide and reserpine combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. Thiazide therapy improves cardiovascular outcomes in patients with hypertension. Reserpine is infrequently used alone for the treatment of hypertension due to possible side effects. See Cardiovascular Considerations for individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Hydromorphone Tablets: Recall Due to Potential for Oversized Tablets – December 2008

Ethex Corporation, in conjunction with the Federal Drug Administration (FDA), is notifying practitioners of a voluntary nationwide recall of a single lot of hydromorphone 2 mg tablets. The tablets are being recalled due to the potential for oversized tablets which may contain increased amounts of the active ingredient. In addition, as a precaution, KV Pharmaceutical (the parent company of Ethex Corporation) is voluntarily suspending shipments of all FDA-approved drug products in a tablet form so the company may address manufacturing issues that have come to management's attention.

For additional information, please refer to the MedWatch Alert at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Hydromorphone

Medication Safety Issues

Sound-alike/look-alike issues:

Dilaudid® may be confused with Demerol®, Dilantin®

HYDROmorphone may be confused with morphine; significant overdoses have occurred when hydromorphone products have been inadvertently administered instead of morphine sulfate. Commercially available prefilled syringes of both products looks similar and are often stored in close proximity to each other. **Note:** Hydromorphone 1 mg oral is approximately equal to morphine 4 mg oral; hydromorphone 1 mg I.V. is approximately equal to morphine 5 mg I.V.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Dilaudid®, Dilaudid-HP®: Extreme caution should be taken to avoid confusing the highly-concentrated (Dilaudid-HP®) injection with the less-concentrated (Dilaudid®) injectable product.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

Pronunciation(hye droe MOR fone)

U.S. Brand NamesDilaudid-HP®; Dilaudid®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of moderate-to-severe pain

Use: Unlabeled/InvestigationalAntitussive

Dosing: Adults

Antitussive (unlabeled use): Oral: 1 mg every 3-4 hours as needed

Acute pain (moderate to severe):Note: These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention. Doses should be titrated to appropriate analgesic effects; when changing routes of administration, note that oral doses are <50% as effective as parenteral doses (may be only one-fifth as effective).

Oral:

Initial: Opiate-naive: 2-4 mg every 3-6 hours as needed; elderly/debilitated patients may require lower doses; patients with prior opiate exposure may require higher initial doses

Usual dosage range: 2-8 mg every 3-4 hours as needed

I.V.: Initial: Opiate-naive: 0.2-0.6 mg every 2-3 hours as needed; patients with prior opiate exposure may tolerate higher initial doses

Critically-ill patients (unlabeled dose): 0.7-2 mg (based on 70 kg patient) every 1-2 hours as needed. **Note:** More frequent dosing may be needed (eg, mechanically-ventilated patients).

Continuous infusion: Usual dosage range: 0.5-1 mg/hour (based on 70 kg patient) or 7-15 mcg/kg/hour

Patient-controlled analgesia (PCA): (Opiate-naive: Consider lower end of dosing range)

Usual concentration: 0.2 mg/mL

Demand dose: Usual: 0.1-0.2 mg; range: 0.05-0.5 mg

Lockout interval: 5-15 minutes

4-hour limit: 4-6 mg

Epidural:

Bolus dose: 1-1.5 mg

Infusion concentration: 0.05-0.075 mg/mL

Infusion rate: 0.04-0.4 mg/hour

Demand dose: 0.15 mg

Lockout interval: 30 minutes

I.M., SubQ: **Note:** I.M. use may result in variable absorption and a lag time to peak effect.

Initial: Opiate-naive: 0.8-1 mg every 4-6 hours as needed; patients with prior opiate exposure may require higher initial doses

Usual dosage range: 1-2 mg every 3-6 hours as needed

Rectal: 3 mg every 4-8 hours as needed

Chronic pain: **Note:** Patients taking opioids chronically may become tolerant and require doses higher than the usual dosage range to maintain the desired effect. Tolerance can be managed by appropriate dose titration. There is no optimal or maximal dose for hydromorphone in chronic pain. The appropriate dose is one that relieves pain throughout its dosing interval without causing unmanageable side effects.

Controlled release formulation (Hydromorph Contin®, not available in U.S.): Oral: 3-30 mg every 12 hours. **Note:** A patient's hydromorphone requirement should be established using prompt release formulations; conversion to long acting products may be considered when chronic, continuous treatment is required. Higher dosages should be reserved for use only in opioid-tolerant patients.

Dosing: ElderlyDoses should be titrated to appropriate analgesic effects. When changing routes of administration, note that oral doses are less than half as effective as parenteral doses (may be only 20% as effective).

Pain: Oral: 1-2 mg every 4-6 hours

Antitussive: Refer to adult dosing.

Dosing: Pediatric

Acute pain (moderate to severe): **Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention.

Children ≥6 months and <50 kg:

Oral: 0.03-0.08 mg/kg/dose every 3-4 hours as needed

I.V.: 0.015 mg/kg/dose every 3-6 hours as needed

Children >50 kg: Refer to adult dosing.

Antitussive (unlabeled use): Oral:

Children 6-12 years: 0.5 mg every 3-4 hours as needed

Children >12 years: 1 mg every 3-4 hours as needed

Dosing: Hepatic ImpairmentDose adjustment should be considered.

Calculations

- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: I.M.May be given SubQ or I.M.; vial stopper contains latex

Administration: I.V.For IVP, must be given slowly over 2-3 minutes (rapid IVP has been associated with an increase in side effects, especially respiratory depression and hypotension)

Administration: I.V. DetailpH: 4.0-5.5

Administration: OralHydromorph Contin®: Capsule should be swallowed whole; do not crush or chew; contents may be sprinkled on soft food and swallowed

Administration: OtherMay be given SubQ or I.M.

StorageStore injection and oral dosage forms at 15°C to 30°C (59°F to 86°F). Protect tablets from light. A slightly yellowish discoloration has not been associated with a loss of potency.

CompatibilityStable in D_5LR, D_5W, $D_5{}^1/_2NS$, D_5NS, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amikacin, amsacrine, aztreonam, cefamandole, cefepime, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, epinephrine, erythromycin lactobionate, etoposide, famotidine, fentanyl, filgrastim, fludarabine, foscarnet, furosemide, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, kanamycin, labetalol, linezolid, lorazepam, magnesium sulfate, melphalan, methotrexate, metronidazole, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, paclitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, propofol, ranitidine, remifentanil, tacrolimus, teniposide, thiotepa, ticarcillin, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, diazepam, minocycline, phenobarbital, phenytoin, sargramostim, tetracycline, thiopental. **Variable (consult detailed reference):** Ampicillin, cefazolin.

Compatibility in syringe: Compatible: Albuterol, atropine, bupivacaine, ceftazidime, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, fentanyl, glycopyrrolate, haloperidol, hydroxyzine, lorazepam, midazolam, pentazocine, pentobarbital, prochlorperazine mesylate, promethazine, ranitidine, scopolamine, thiethylperazine, trimethobenzamide. **Incompatible:** Ampicillin, diazepam, hyaluronidase, phenobarbital, phenytoin. **Variable (consult detailed reference):** Cefazolin, dexamethasone sodium phosphate, ketorolac, prochlorperazine edisylate.

Compatibility when admixed: Compatible: Bupivacaine, fluorouracil, midazolam, ondansetron, promethazine, verapamil. **Incompatible:** Sodium bicarbonate, thiopental. **Variable (consult detailed reference):** Tetracaine.

RestrictionsC-II

ContraindicationsHypersensitivity to hydromorphone, any component of the formulation; acute or severe asthma, severe respiratory depression (in absence of resuscitative equipment or ventilatory support); severe CNS depression; pregnancy (prolonged use or high doses at term); obstetrical analgesia

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Abuse/misuse/diversion: See "Other warnings/precautions" below.
- Injection: See "Dosage form specific issues" below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydrocodone, levorphanol, oxycodone, oxymorphone).
- Seizures: Myoclonus and seizures have been reported with high doses.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Psychoses: Use with caution in patients with toxic psychoses.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

Dosage form specific issues:

- Controlled release capsules: Should only be used when continuous analgesia is required over an extended period of time. Controlled release products are not to be used on an "as needed" (PRN) basis.

- Injection: **[U.S. Boxed Warning]: Extreme caution should be taken to avoid confusing the highly-concentrated (Dilaudid-HP®) injection with the less-concentrated (Dilaudid®) injectable product.** Dilaudid-HP® should only be used in patients who are opioid-tolerant.

- Sodium metabisulfite: Some dosage forms contain trace amounts of sodium metabisulfite which may cause allergic reactions in susceptible individuals.

Other warnings/precautions:

- Abuse/misuse/diversion: **[U.S. Boxed Warning]: Hydromorphone has a high potential for abuse;** healthcare provider should be alert to problems of abuse, misuse, and diversion.

- I.M. administration: Variable absorption and a lag time to peak effect may result from I.M. use.

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsElderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics.
Pregnancy Risk FactorC/D (prolonged use or high doses at term)
Pregnancy ConsiderationsHydromorphone was teratogenic in some, but not all, animal studies; however, maternal toxicity was also reported. Hydromorphone crosses the placenta. Chronic opioid use during pregnancy may lead to a withdrawal syndrome in the neonate. Symptoms include irritability, hyperactivity, loss of sleep pattern, abnormal crying, tremor, vomiting, diarrhea, weight loss, or failure to gain weight.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsOther opioid analgesics can be found in breast milk; specific data for hydromorphone is not available. The possibility of sedation or respiratory depression in the nursing infant should be considered.
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, flushing of face, hyper-/hypotension, palpitation, peripheral vasodilation, syncope, tachycardia

Central nervous system: Agitation, chills, CNS depression, dizziness, drowsiness, dysphoria, euphoria, fatigue, hallucinations, headache, increased intracranial pressure, insomnia, lightheadedness, mental depression, nervousness, restlessness, sedation, seizure

Dermatologic: Pruritus, rash, urticaria

Endocrine & metabolic: Antidiuretic hormone release

Gastrointestinal: Anorexia, biliary tract spasm, constipation, diarrhea, nausea, paralytic ileus, stomach cramps, taste perversion, vomiting, xerostomia

Genitourinary: Ureteral spasm, urinary retention, urinary tract spasm, urination decreased

Hepatic: LFTs increased

Local: Pain at injection site (I.M.), wheal/flare over vein (I.V.)

Neuromuscular & skeletal: Myoclonus, paresthesia, trembling, tremor, weakness

Ocular: Blurred vision, diplopia, miosis, nystagmus

Respiratory: Apnea, bronchospasm, dyspnea, laryngospasm, respiratory depression

Miscellaneous: Diaphoresis, histamine release, physical and psychological dependence

Oncology: VesicantNo
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic

doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersPain relief, respiratory and mental status, blood pressure

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor for effectiveness of pain relief, adverse reactions, and signs of overdose at beginning of therapy and periodically during long-term use. May cause physical and/or psychological dependence. Monitor blood pressure, CNS and respiratory status, and degree of sedation at beginning of therapy and at regular intervals with long-term use. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects. Discontinue slowly after prolonged use.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); loss of appetite, nausea, or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report chest pain, slow or rapid heartbeat, acute dizziness, or persistent headache; swelling of extremities or unusual weight gain; changes in urinary elimination; acute headache; back or flank pain or spasms; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule, controlled release:

Hydromorph Contin® [CAN]: 3 mg, 6 mg, 12 mg, 18 mg, 24 mg, 30 mg [not available in U.S.]

Injection, powder for reconstitution, as hydrochloride:

Dilaudid-HP®: 250 mg [may contain trace amounts of sodium bisulfite]

Injection, solution, as hydrochloride: 1 mg/mL (1 mL); 2 mg/mL (1 mL, 20 mL); 4 mg/mL (1 mL)

Dilaudid®: 1 mg/mL (1 mL); 2 mg/mL (1 mL, 20 mL) [20 mL size contains edetate sodium; vial stopper contains latex]; 4 mg/mL (1 mL)

Injection, solution, as hydrochloride [preservative free]: 10 mg/mL (1 mL, 5 mL, 50 mL)

Dilaudid-HP®: 10 mg/mL (1 mL, 5 mL) [contains sodium metabisulfate]

Dilaudid-HP®: 10 mg/mL (50 mL) [contains natural rubber/natural latex in packaging, sodium metabisulfate]

Liquid, oral, as hydrochloride:

Dilaudid®: 1 mg/mL (480 mL) [may contain trace amounts of sodium bisulfite]

Powder, for prescription compounding: 100% (15 grain)

Suppository, rectal, as hydrochloride: 3 mg

Dilaudid®: 3 mg (6s)

Tablet, as hydrochloride: 2 mg, 4 mg, 8 mg

Dilaudid®: 2 mg, 4 mg, 8 mg (8 mg tablets may contain trace amounts of sodium bisulfite)

Generic AvailableYes: Excludes capsule, liquid, powder for injection

Pricing: U.S. (www.drugstore.com)

Solution (Hydromorphone HCl)

4 mg/mL (20): $33.33

Suppository (Hydromorphone HCl)

3 mg (20): $159.17

Tablets (Dilaudid)

2 mg (20): $23.99

4 mg (20): $29.99

8 mg (100): $197.41

Tablets (Hydromorphone HCl)

2 mg (20): $15.33

4 mg (20): $15.99

8 mg (20): $27.99

Mechanism of Action Binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; causes cough supression by direct central action in the medulla; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action: Analgesic: Immediate release formulations:

Oral: 15-30 minutes

Peak effect: Oral: 30-60 minutes

Duration: Immediate release formulations: 4-5 hours

Absorption: I.M.: Variable and delayed

Distribution: V_d: 4 L/kg

Protein binding: ~8% to 19%

Metabolism: Hepatic via glucuronidation; to inactive metabolites

Bioavailability: 62%

Half-life elimination: Immediate release formulations: 1-3 hours

Excretion: Urine (primarily as glucuronide conjugates)

Related Information

- Narcotic / Opioid Analgesics

Pharmacotherapy Pearls Equianalgesic doses: Morphine 10 mg I.M. = hydromorphone 1.5 mg I.M.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness and dizziness are common; may cause nervousness or restlessness; may rarely cause hallucinations or depression

Mental Health: Effects on Psychiatric Treatment Concurrent use with psychotropics may produce additive sedation

Anesthesia and Critical Care Concerns/Other Considerations When developing a therapeutic plan for pain control, scheduled, intermittent opioid dosing or continuous infusion is preferred over the “as needed” regimen. The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend fentanyl in patients who need immediate pain relief because of its rapid onset of action; fentanyl or hydromorphone is preferred in patients who are hypotensive or have renal dysfunction. Morphine or hydromorphone is recommended for intermittent, scheduled therapy. Both have a longer duration of action requiring less frequent administration. Hydromorphone does not have any active metabolites, has less protein binding than other opiates and does not cause histamine release. If the patient has required high-dose analgesia or has used for a prolonged period (~7 days), taper dose to prevent withdrawal; monitor for signs and symptoms of withdrawal.

Index Terms Dihydromorphinone; Hydromorphone Hydrochloride

Pharmacologic CategoryDepigmenting Agent
Use: Labeled IndicationsGradual bleaching of hyperpigmented skin conditions
Dosing: AdultsBleaching: Topical: Apply a thin layer and rub in twice daily.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: TopicalFor external use only; avoid contact with eyes
ContraindicationsHypersensitivity to hydroquinone or any component of the formulation; sunburn, depilatory usage
Warnings/Precautions

Other warnings/precautions:

- Appropriate use: Limit application to area no larger than face and neck or hands and arms.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Dermatologic: Dermatitis, dryness, erythema, stinging, inflammatory reaction, sensitization

Local: Irritation

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringSee application directions above. When applied to large areas or for extensive periods of time, monitor for adverse reactions. Assess knowledge/teach patient appropriate application and use and adverse symptoms to report.
Patient EducationUse exactly as directed; do not overuse. Therapeutic effect may take several weeks. Test response by applying to small area of unbroken skin and check in 24 hours; if irritation or blistering occurs do not use. Avoid contact with eyes. Do not apply to open wounds or weeping areas. Before using, wash and dry area gently. Apply a thin film to affected area and rub in gently. Avoid direct sunlight or use sunblock or protective clothing to prevent repigmentation. Report swelling, redness, rash, itching, signs of infection, worsening of condition, or lack of healing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Mechanism of ActionProduces reversible depigmentation of the skin by suppression of melanocyte metabolic processes, in particular the inhibition of the enzymatic oxidation of tyrosine to DOPA (3,4-dihydroxyphenylalanine); sun exposure reverses this effect and will cause repigmentation.

Pharmacodynamics/KineticsOnset and duration of depigmentation produced by hydroquinone varies among individuals

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Jump To Field (Select Field Name)

Pronunciation(hye droks oh koe BAL a min)

U.S. Brand NamesCyanokit®

Pharmacologic CategoryAntidote; Vitamin, Water Soluble

Use: Labeled IndicationsTreatment of pernicious anemia, vitamin B_{12} deficiency due to dietary deficiencies or malabsorption diseases, inadequate secretion of intrinsic factor, and inadequate utilization of B_{12} (eg, during neoplastic treatment); diagnostic agent for Schilling test

Cyanokit®: Treatment of cyanide poisoning (known or suspected)

Use: Unlabeled/InvestigationalNeuropathies

Dosing: Adults

Vitamin B_{12} deficiency: I.M.: 30 mcg/day for 5-10 days, followed by 100-200 mcg/month

Note: Larger doses may be required in critically-ill patients or if patient has neurologic disease, an infectious disease, or hyperthyroidism.

Schilling test: I.M.: 1000 mcg

Cyanide toxicity (Cyanokit®): I.V.: Initial: 5 g as single infusion; may repeat a second 5 g dose depending on severity of poisoning and clinical response. Maximum cumulative dose: 10 g. **Note:** If suspected, antidotal therapy must be given immediately.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricVitamin B_{12} deficiency: I.M.: 100 mcg once daily for 2 or more weeks (total dose: 1-5 mg); maintenance: 30-50 mcg/month

Administration: I.M.Solution for I.M. injection: Administer 1000 mcg/mL solution I.M. only

Administration: I.V.Cyanokit®: Administer by I.V. infusion over 15 minutes; if repeat dose needed, administer second dose over 15 minutes to 2 hours

Storage

Solution for I.M. injection: Store at 20°C to 25°C (68°F to 77°F). Protect from light.

I.V. infusion (Cyanokit®): Prior to reconstitution, store at 15°C to 30°C (59°F to 86°F).

Temperature variation exposure allowed for transport of lyophilized form:

Usual transport: ≤15 days at 5°C to 40°C (41°F to 104°F)

Desert transport: ≤4 days at 5°C to 60°C (41°F to 140°F)

Freezing/defrosting cycles: ≤15 days at -20°C to 40°C (-4°F to 104°F)

Following reconstitution, store up to 6 hours at ≤40°C (104°F); do not freeze. Discard any remaining solution after 6 hours.

ReconstitutionI.V. infusion (Cyanokit®): Reconstitute each 2.5 g vial with 100 mL of NS using provided sterile transfer spike. If NS unavailable, may use LR or D_5W. Invert or rock each vial for at least 30 seconds prior to infusion; do not shake. Do not use if solution is **not** dark red.

CompatibilityStable in NS (preferred), LR, D_5W

Y-site administration: Incompatible with ascorbic acid, blood products, sodium nitrite, sodium thiosulfate.

Compatibility when admixed: Incompatible with diazepam, dopamine, dobutamine, fentanyl, nitroglycerin, pentobarbital, propofol, thiopental.

ContraindicationsHypersensitivity to hydroxocobalamin, cyanocobalamin, cobalt, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hypertension: Cyanide poisoning: Increased blood pressure (≥180 mm Hg systolic or ≥110 mm Hg diastolic) is associated with infusion; elevations usually noted at beginning of infusion, peak toward the end of infusion and return to baseline within 4 hours of infusion.
- Photosensitivity: May cause photosensitivity; avoid direct sunlight while skin remains discolored.

Disease-related concerns:

- Anemia: Appropriate use: Neurologic manifestations of vitamin B_{12} deficiency will not be prevented with folic acid unless vitamin B_{12} is also given; spinal cord degeneration might also occur when folic acid is used as a substitute for vitamin B_{12} in anemia prevention.
- Polycythemia vera: Vitamin B_{12} deficiency masks signs of polycythemia vera; vitamin B_{12} administration may unmask this condition.

Dosage form specific concerns:

- Cyanokit®: Use caution or consider alternatives in patients with known allergic reactions, including anaphylaxis to hydroxocobalamin or cyanocobalamin. Collection of pretreatment blood cyanide concentrations does not preclude administration and should not delay administration in the emergency management of highly suspected or confirmed cyanide toxicity. Pretreatment levels may be useful as post infusion levels may be inaccurate. Treatment of cyanide poisoning should include decontamination and supportive therapy. Safety and efficacy have not been established in children.

- Solution for I.M. injection: Treatment of severe vitamin B_{12} megaloblastic anemia may result in thrombocytosis and severe hypokalemia, sometimes fatal, due to intracellular potassium shift upon anemia resolution. Use caution in folic acid deficient megaloblastic anemia; administration of vitamin B_{12} alone is not a substitute for folic acid and might mask true diagnosis. Blunted therapeutic response to vitamin B_{12} may occur in certain conditions (eg, infection, uremia, concurrent iron or folic acid deficiency) or in patients on medications with bone marrow suppressant properties (eg, chloramphenicol). Approved for use as I.M. injection only.

Geriatric ConsiderationsEvidence exists that people, particularly elderly, whose serum cobalamin concentrations are <500 pg/mL, should receive replacement parenteral therapy. This recommendation is based upon neuropsychiatric disorders and cardiovascular disorders associated with lower sodium cobalamin concentrations.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies are insufficient to determine the effect, if any, on pregnancy or fetal development. There are no adequate and well-controlled studies in pregnant women. Data on the use of hydroxocobalamin in pregnancy for the treatment of cyanide poisoning and cobalamin defects are limited.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

I.M. injection: Frequency not defined:

Dermatologic: Exanthema (transient), itching

Gastrointestinal: Diarrhea (mild, transient)

Local: Injection site pain

Miscellaneous: Anaphylaxis

I.V. infusion (Cyanokit®):

>10%:

Cardiovascular: Blood pressure increased (18% to 28%; systolic ≥180 mm Hg or diastolic ≥110 mm Hg)

Central nervous system: Headache (6% to 33%)

Dermatologic: Erythema (94% to 100%; may last up to 2 weeks), rash (predominantly acneiform; 20% to 44%; can appear 7-28 days after administration and usually resolves within a few weeks)

Gastrointestinal: Nausea (6% to 11%)

Genitourinary: Chromaturia (100%; may last up to 5 weeks after administration)

Hematologic: Lymphocytes decreased (8% to 17%)

Local: Infusion site reaction (6% to 39%)

Frequency not defined:

Cardiovascular: Chest discomfort, heart rate increased/decreased, hot flashes, peripheral edema

Central nervous system: Dizziness, memory impairment, restlessness

Dermatologic: Pruritus, urticaria

Gastrointestinal: Abdominal discomfort, diarrhea, dyspepsia, dysphagia, hematochezia, vomiting

Ocular: Irritation, redness, swelling

Respiratory: Dry throat, dyspnea, throat tightness

Miscellaneous: Allergic reaction (including anaphylaxis)

Postmarketing and/or case reports: Angioneurotic edema

Drug InteractionsThere are no known significant interactions.
Test InteractionsThe following values may be affected, *in vitro*, following hydroxocobalamin 5 g dose. Interference following hydroxocobalamin 10 g dose can be expected to last up to an additional 24 hours. **Note:** Extent and duration of interference dependant on analyzer used and patient variability.

Falsely elevated:

Basophils, hemoglobin, MCH, and MCHC [duration: 12-16 hours]

Albumin, alkaline phosphatase, cholesterol, creatinine, glucose, total protein, and triglycerides [duration: 24 hours]

Bilirubin [duration: up to 4 days]

Urinalysis: Glucose, protein, erythrocytes, leukocytes, ketones, bilirubin, urobilinogen, nitrite [duration: 2-8 days]

Falsely decreased: ALT and amylase [duration: 24 hours]

Unpredictable:

AST, CK, CKMB, LDH, phosphate, and uric acid [duration: 24 hours]

PT (quick or INR) and aPTT [duration: 24-48 hours]

Urine pH [duration: 2-8 days]

May also interfere with colorimetric tests

Monitoring ParametersVitamin B_{12}, hematocrit, hemoglobin, reticulocyte count, red blood cell counts, folate and iron levels should be obtained prior to treatment and periodically during treatment.

Cyanide toxicity: Blood pressure and heart rate during and after infusion, serum lactate levels, venous-arterial PO_2 gradient. Pretreatment levels may be useful as post infusion levels may be inaccurate.

Megaloblastic anemia: In addition to normal hematological parameters, serum potassium and platelet counts should be monitored during therapy, particularly in the first 48 hours of treatment.

Reference RangeBlood cyanide levels may be used for diagnosis confirmation; however, reliable levels require prompt testing and proper storage conditions.

Cyanide level:

Tachycardia/flushing: 0.5-1 mg/L

Obtundation: 1-2.5 mg/L

Coma: 2.5-3 mg/L

Death: >3 mg/L

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests at beginning of therapy and periodically with long-term therapy. Assess knowledge/teach patient appropriate administration (injection technique and needle disposal), appropriate nutrition, and adverse symptoms to report. Cyanide toxicity: Monitor blood pressure and heart rate during infusion.

Monitoring: Lab TestsVitamin B_{12}, hematocrit, hemoglobin, reticulocyte count, red blood cell counts, folate and iron levels should be obtained prior to treatment and periodically during treatment.

Cyanide toxicity: Blood pressure and heart rate during and after infusion, serum lactate levels, venous-arterial PO_2 gradient. Pretreatment levels may be useful as post infusion levels may be inaccurate.

Megaloblastic anemia: In addition to normal hematological parameters, serum potassium and platelet counts should be monitored during therapy, particularly in the first 48 hours of treatment.

Patient EducationUse exactly as directed. Pernicious anemia may require monthly injections for life. Report skin rash; swelling, pain, or redness in extremities; or acute persistent diarrhea. Cyanokit®: May cause headache, redness of skin (can last up to 2 weeks; avoid exposure to sun while skin is red), skin lesions (can appear 7-28 days after infusion), and red urine (can last for 5 weeks). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 1000 mcg/mL (30 mL)

Injection, powder for reconstitution:

Cyanokit®: 2.5 g (2 vials) [provided in a kit which also contains one I.V. infusion set]

Generic AvailableYes: Excludes powder for injection

Mechanism of ActionHydroxocobalamin (vitamin B_{12a}) is a precursor to cyanocobalamin (vitamin B_{12}). Cyanocobalamin acts as a coenzyme for various metabolic functions, including fat and carbohydrate metabolism and protein synthesis, used in cell replication and hematopoiesis. In the presence of cyanide, each hydroxocobalamin molecule can bind one cyanide ion by displacing it for the hydroxo ligand linked to the trivalent cobalt ion, forming cyanocobalamin.

Pharmacodynamics/KineticsFollowing I.V. administration of Cyanokit®:

Protein binding: Significant; forms various cobalamin-(III) complexes

Half-life elimination: 26-31 hours

Excretion: Urine (50% to 60% within initial 72 hours)

Pharmacotherapy PearlsExpert advice from a regional poison control center for appropriate use may be obtained (1-800-222-1222). Cyanide is a clear colorless gas or liquid with a faint bitter almond odor. Cyanide reacts with trivalent ions in cytochrome oxidase in the mitochondria leading to histotoxic hypoxia and lactic acidosis. Signs and symptoms of cyanide toxicity include headache, altered mental status, dyspnea, mydriasis, chest tightness, nausea, vomiting, tachycardia/hypertension (initially), bradycardia/hypotension (later), seizures, cardiovascular collapse, or coma.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsVitamin B_{12a}

Hydroxyamphetamine and Tropicamide

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(hye droks ee am FET a meen & troe PIK a mide)
U.S. Brand NamesParemyd®
Pharmacologic CategoryAdrenergic Agonist Agent, Ophthalmic
Use: Labeled IndicationsShort-term pupil dilation for diagnostic procedures and exams
Dosing: AdultsMydriasis/cycloplegia: Ophthalmic: Instill 1-2 drops into conjunctival sac(s)
Dosing: ElderlyRefer to adult dosing.
StorageStore at 15°C to 25°C (59°F to 77°F). Protect from light.
ContraindicationsHypersensitivity to hydroxyamphetamine, tropicamide, or any component of the formulation; angle-closure glaucoma or those with narrow angles where dilation of the pupil may precipitate angle-closure glaucoma
Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Disease-related concerns:

- Glaucoma: Use with caution in patients with glaucoma; increased ocular pressure may occur following administration.

Special populations:

- Elderly: Use with caution in the elderly; monitor closely for increased intraocular pressure following use.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only.

- Monitoring: Patients with hypertension, hyperthyroidism, diabetes, or cardiac disease should be monitored after instillation.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined (as reported with Paremyd® or similar medications):

Cardiovascular: Hypotension, MI, pallor, tachycardia, ventricular fibrillation

Central nervous system: Behavioral disturbances, headache, psychotic reactions

Gastrointestinal: Dry mouth, nausea, vomiting

Neuromuscular & skeletal: Muscle rigidity

Ocular: Blurred vision, intraocular pressure increased, photophobia, transient stinging

Miscellaneous: Allergic reaction, cardiorespiratory collapse, vasomotor collapse

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: Hydroxyamphetamine hydrobromide 1% and tropicamide 0.25% (15 mL) [contains benzalkonium chloride]

Generic AvailableNo
ManufacturerAkorn, Inc
Mechanism of ActionHydroxyamphetamine hydrobromide is an indirect acting sympathomimetic agent which causes the release of norepinephrine from adrenergic nerve terminals, resulting in mydriasis. Tropicamide is a parasympatholytic agent which produces mydriasis and paralysis by blocking the sphincter muscle in the iris and the ciliary muscle.
Pharmacodynamics/Kinetics

Onset of action: 15 minutes

Duration: 3 hours; complete recovery usually occurs in 6-8 hours, but may take up to 24 hours

Time to peak: 60 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsHydroxyamphetamine Hydrobromide and Tropicamide; Tropicamide and Hydroxyamphetamine

Hydroxychloroquine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

> Hydroxychloroquine may be confused with hydrocortisone
>
> Plaquenil® may be confused with Platinol®

Pronunciation(hye droks ee KLOR oh kwin)

U.S. Brand NamesPlaquenil®

Canadian Brand NamesApo-Hydroxyquine®; Gen-Hydroxychloroquine; Plaquenil®; Pro-Hydroxyquine

Pharmacologic CategoryAminoquinoline (Antimalarial)

Use: Labeled IndicationsSuppression and treatment of acute attacks of malaria; treatment of systemic lupus erythematosus (SLE) and rheumatoid arthritis

Use: Unlabeled/InvestigationalPorphyria cutanea tarda, polymorphous light eruptions

Dosing: Adults

Note: Hydroxychloroquine sulfate 200 mg is equivalent to 155 mg hydroxychloroquine base and 250 mg chloroquine phosphate. Second-line alternative treatment (chloroquine is preferred).

Chemoprophylaxis of malaria: 310 mg (base) weekly on same day each week; begin 2 weeks before exposure. Continue for 4 weeks (per CDC guidelines) after leaving endemic area; if suppressive therapy is not begun prior to the exposure, double the initial dose and give in 2 doses, 6 hours apart for 8 weeks.

Malaria, acute attack: 620 mg (base) initially, followed by 310 mg (base) at 6, 24, and 48 hours

Rheumatoid arthritis: Initial: 310-465 mg/day (base) taken with food or milk; increase dose gradually until optimum response level is reached; usually after 4-12 weeks dose should be reduced by $^1/_2$ to a maintenance dose of 155-310 mg/day (base)

Lupus erythematosus: 310 mg (base) every day or twice daily for several weeks-months depending on response; 155-310 mg/day (base) for prolonged maintenance therapy

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Note: Hydroxychloroquine sulfate 200 mg is equivalent to 155 mg hydroxychloroquine base and 250 mg chloroquine phosphate.

Chemoprophylaxis of malaria: Oral: 5 mg/kg (base) once weekly; should not exceed the recommended adult dose. Begin 2 weeks before exposure and continue for 4-6 weeks after leaving endemic area. If suppressive therapy is not begun prior to the exposure, double the initial dose and give in 2 doses, 6 hours apart for 8 weeks.

Malaria, acute attack: Oral: 10 mg/kg (base) initially, followed by 5 mg/kg (base) at 6, 24, and 48 hours.

Juvenile rheumatoid arthritis (JRA) or SLE (unlabeled use): Oral: 3-5 mg/kg/day (base) divided 1-2 times/day; avoid exceeding 7 mg/kg/day.

Dosing: Hepatic ImpairmentUse with caution; dosage adjustment may be necessary.

Administration: OralTake with food or milk.

Dietary ConsiderationsMay be taken with food or milk.

Extemporaneously PreparedA 25 mg/mL hydroxychloroquine sulfate suspension is made by removing the coating off of fifteen 200 mg hydroxychloroquine sulfate tablets with a towel moistened with alcohol; tablets are ground to a fine powder and levigated to a paste with 15 mL of Ora-Plus® suspending agent; add an additional 45 mL of suspending agent and levigate until a uniform mixture is obtained; qs ad to 120 mL with sterile water for irrigation; a 30 day expiration date is recommended, although stability testing has not been performed

> Pesko LJ, “Compounding: Hydroxychloroquine,” *Am Druggist*, 1993, 207:57.

ContraindicationsHypersensitivity to hydroxychloroquine, 4-aminoquinoline derivatives, or any component of the formulation; retinal or visual field changes attributable to 4-aminoquinolines; long-term use in children

Allergy Considerations

- QuiNIDine/QuiNINE Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Cardiovascular: Rare cardiomyopathy has been associated with long-term use of hydroxychloroquine.

- Hematologic: Aminoquinolines have been associated with rare hematologic reactions, including agranulocytosis, aplastic anemia, and thrombocytopenia; monitoring (CBC) is recommended in prolonged therapy.

- Neuromuscular: Myopathy, neuromyopathy, and progressive weakness have been associated with aminoquinoline derivatives; muscle strength (especially proximal muscles) should be assessed periodically during prolonged therapy.

- Ophthalmic effects: Hydroxychloroquine has been associated with important adverse effects on vision, including loss of visual acuity, macular pigmentary changes, and loss of foveal reflex. Monitoring is recommended in long-term therapy.

Disease-related concerns:

- G6PD deficiency: Use with caution in patients with known G6PD; use of 4-aminoquinolines such as chloroquine has been associated with hemolysis and renal impairment in this population.

- Hepatic impairment: Use with caution in patients with hepatic impairment, alcoholism, or concurrent therapy with hepatotoxic agents.

- Porphyria: Use with caution in patients with porphyria; may exacerbate disease.

- Psoriasis: Use with caution in patients with psoriasis; may exacerbate disease.

Special populations:

- Pediatrics: Use caution due to increased sensitivity to aminoquinolones; long-term use in children is contraindicated.

Other warnings/precautions:

- Appropriate use: Malaria: Hydroxychloroquine is not effective against chloroquine-resistant strains of *P. falciparum*.

- Experienced physician: **[U.S. Boxed Warning]: Should be prescribed by physicians familiar with its use.**

Geriatric ConsiderationsNo specific recommendations for dosing.

Pregnancy ConsiderationsMalaria infection in pregnant women may be more severe than in nonpregnant women. Therefore, pregnant women and women who are likely to become pregnant are advised to avoid travel to malaria-risk areas. Hydroxychloroquine is recommended as an alternative treatment of pregnant women for uncomplicated malaria in chloroquine-sensitive regions. Women exposed to hydroxychloroquine for the treatment of rheumatoid arthritis or systemic lupus erythematosus during pregnancy may be enrolled in the Organization of Teratology Information Specialists (OTIS) Autoimmune Diseases Study pregnancy registry (877-311-8972).

LactationEnters breast milk (AAP considers “compatible”)

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiomyopathy (rare, relationship to hydroxychloroquine unclear)

Central nervous system: Ataxia, dizziness, emotional changes, headache, irritability, lassitude, nervousness, nightmares, psychosis, seizure, vertigo

Dermatologic: Alopecia, angioedema, bleaching of hair, pigmentation changes (skin and mucosal; black-blue color), rash (acute generalized exanthematous pustulosis, erythema annulare centrifugum, exfoliative dermatitis, lichenoid, maculopapular, morbilliform, purpuric, Stevens-Johnson syndrome, urticarial), urticaria

Endocrine & metabolic: Weight loss

Gastrointestinal: Abdominal cramping, anorexia, diarrhea, nausea, vomiting

Hematologic: Agranulocytosis, aplastic anemia, hemolysis (in patients with glucose-6-phosphate deficiency), leukopenia, thrombocytopenia

Hepatic: Abnormal liver function/hepatic failure (isolated cases)

Neuromuscular & skeletal: Myopathy, palsy, or neuromyopathy leading to progressive weakness and atrophy of proximal muscle groups (may be associated with mild sensory changes, loss of deep tendon reflexes, and abnormal nerve conduction)

Ocular: Abnormal color vision, abnormal retinal pigmentation, atrophy, attenuation of retinal arterioles, decreased visual acuity, disturbance in accommodation, keratopathy, corneal changes/deposits (visual disturbances, blurred vision, photophobia [reversible on discontinuation]), macular edema, nystagmus, optic disc pallor/atrophy, pigmentary retinopathy, retinopathy (early changes reversible [may progress despite discontinuation if advanced]), scotoma

Otic: Deafness, tinnitus

Miscellaneous: Exacerbation of porphyria and nonlight sensitive psoriasis

Respiratory: Bronchospasm, respiratory failure (myopathy-related)

Drug Interactions

Anthelmintics: Aminoquinolines (Antimalarial) may decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Beta-Blockers: Aminoquinolines (Antimalarial) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoquinolines (Antimalarial) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Mefloquine: Aminoquinolines (Antimalarial) may enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Mefloquine may increase the serum concentration of Aminoquinolines (Antimalarial). Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of an aminoquinoline antimalarial when possible. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Monitoring ParametersOphthalmologic exam at baseline and every 3 months during prolonged therapy (including visual acuity, slit-lamp, fundoscopic, and visual field exam); CBC at baseline and periodically; muscle strength (especially proximal, as a symptom of neuromyopathy) during long-term therapy

Nursing: Physical Assessment/MonitoringEvaluate need for cautions prior to beginning therapy. Assess potential for interactions with other pharmacological agents patient may be taking. Assess results of periodic CBC and liver function tests, therapeutic effectiveness (according to purpose for therapy), and adverse response (eg, deep tendon reflexes, muscle weakness). Teach patient appropriate use, possible side effects/interventions (necessity for periodic ophthalmic examinations with long-term therapy), and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. It is important to complete full course of therapy, which may take up to 6 months for full effect. May be taken with meals to decrease GI upset and bitter aftertaste. Avoid alcohol. You should have regular ophthalmic exams (every 4-6 months) if using this medication over extended periods. You may experience skin discoloration (blue/black), hair bleaching, or skin rash. If you have psoriasis, you may experience exacerbation. You may experience dizziness, headache, nervousness, abnormal color vision, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or increased sensitivity to sunlight (wear dark glasses and protective clothing, use sunblock, and avoid direct exposure to sunlight). Report weakness, numbness, tingling or tremors in muscles; vision changes; rash or itching; persistent diarrhea or GI disturbances; change in hearing acuity or ringing in the ears; chest pain or palpitation; CNS changes; unusual fatigue; easy bruising or bleeding, or any other persistent adverse reactions. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as sulfate: 200 mg [equivalent to 155 mg base]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Plaquenil)

200 mg (60): $173.58

Mechanism of ActionInterferes with digestive vacuole function within sensitive malarial parasites by increasing the pH and interfering with lysosomal degradation of hemoglobin; inhibits locomotion of neutrophils and chemotaxis of eosinophils; impairs complement-dependent antigen-antibody reactions

Pharmacodynamics/Kinetics

Onset of action: Rheumatic disease: May require 4-6 weeks to respond

Absorption: Rapid and complete

Protein binding: 55%

Metabolism: Hepatic

Half-life elimination: 32-50 days

Time to peak: Rheumatic disease: Several months

Excretion: Urine (as metabolites and unchanged drug); may be enhanced by urinary acidification

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or nervousness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine

Index TermsHydroxychloroquine Sulfate

Pronunciation(hye droks ee PROE pil SEL yoo lose)
U.S. Brand NamesLacrisert速
Canadian Brand NamesLacrisert速
Pharmacologic CategoryOphthalmic Agent, Miscellaneous
Use: Labeled IndicationsDry eyes (moderate to severe)
Dosing: AdultsOcular lubricant: Ophthalmic: Apply once daily into the inferior cul-de-sac beneath the base of tarsus, not in apposition to the cornea nor beneath the eyelid at the level of the tarsal plate
Dosing: ElderlyRefer to adult dosing.
Adverse ReactionsFrequency not defined: Ocular: Local irritation, blurred vision, edema of the eyelids
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Insert, ophthalmic [preservative free]: 5 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

INST (Lacrisert)

5 mg (60): $222.59

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Hydroxyurea

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Hydroxyurea may be confused with hydrOXYzine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Hydrea® may be confused with Hydra® which is a brand name for isoniazid in Japan

Pronunciation(hye droks ee yoor EE a)

U.S. Brand NamesDroxia®; Hydrea®; Mylocel™

Canadian Brand NamesApo-Hydroxyurea®; Gen-Hydroxyurea; Hydrea®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite

Use: Labeled IndicationsTreatment of melanoma, refractory chronic myelocytic leukemia (CML), relapsed and refractory metastatic ovarian cancer; radiosensitizing agent in the treatment of squamous cell head and neck cancer (excluding lip cancer); adjunct in the management of sickle cell patients who have had at least three painful crises in the previous 12 months (to reduce frequency of these crises and the need for blood transfusions)

Use: Unlabeled/InvestigationalTreatment of HIV; treatment of psoriasis, treatment of hematologic conditions such as essential thrombocythemia, polycythemia vera, hypereosinophilia, and hyperleukocytosis due to acute leukemia; treatment of uterine, cervix and nonsmall cell lung cancers; radiosensitizing agent in the treatment of primary brain tumors; has shown activity against renal cell cancer and prostate cancer

Dosing: AdultsRefer to individual protocols.

Note: Dose should always be titrated to patient response and WBC counts; usual oral doses range from 10-30 mg/kg/day or 500-3000 mg/day; if WBC count falls to <2500 cells/mm^3, or the platelet count to <100,000/mm^3, therapy should be stopped for at least 3 days and resumed when values rise toward normal.

Solid tumors: Oral:

Intermittent therapy: 80 mg/kg as a single dose every third day

Continuous therapy: 20-30 mg/kg/day given as a single dose/day

Concomitant therapy with irradiation: 80 mg/kg as a single dose every third day starting at least 7 days before initiation of irradiation

Resistant chronic myelocytic leukemia: Oral: Continuous therapy: 20-30 mg/kg once daily

HIV (unlabeled use; in combination with antiretroviral agents): 1000-1500 mg daily in single or divided doses

Psoriasis: 1000-1500 mg daily in single or divided doses

Sickle cell anemia (moderate/severe disease): Initial: 15 mg/kg/day, increased by 5 mg/kg every 12 weeks if blood counts are in an acceptable range until the maximum tolerated dose of 35 mg/kg/day is achieved or the dose that does not produce toxic effects

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. All doses should be based on ideal or actual body weight, whichever is less: Children (unlabeled use):

Note: No FDA-approved dosage regimens have been established; dosages of 1500-3000 mg/m^2 as a single dose in combination with other agents every 4-6 weeks have been used in the treatment of pediatric astrocytoma, medulloblastoma, and primitive neuroectodermal tumors

CML: Oral: Initial: 10-20 mg/kg/day once daily; adjust dose according to hematologic response

Dosing: Renal Impairment

The FDA-approved labeling recommends the following adjustment:

Sickle cell anemia: Cl$_{cr}$ <60 mL/minute or ESRD: Reduce initial dose to 7.5 mg/kg; titrate to response/avoidance of toxicity (refer to usual dosing).

Other indications: It is recommended to reduce the initial dose; however, no specific guidelines are available.

The following guidelines have been used by some clinicians:

Aronoff, 2007: Adults:

Cl_{cr} 10-50 mL/minute: Administer 50% of dose

Cl_{cr} <10 mL/minute: Administer 20% of dose

Hemodialysis: Administer dose after dialysis on dialysis days; supplemental dose is not necessary. Hydroxyurea is a low molecular weight compound with high aqueous solubility that may be freely dialyzable, however, clinical studies confirming this hypothesis have not been performed.

Continuous renal replacement therapy (CRRT): Administer 50% of dose

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 85% of dose

Cl_{cr} 31-45 mL/minute: Administer 80% of dose

Cl_{cr} <30 mL/minute: Administer 75% of dose

Dosing: Hepatic ImpairmentSpecific guidelines are not available for dosage adjustment in hepatic impairment. The FDA-approved labeling recommends closely monitoring for bone marrow toxicity in patients with hepatic impairment.

Dosing: Adjustment for Toxicity

Acceptable range:

Neutrophils ≥2500 cells/mm^3

Platelets ≥95,000/mm^3

Hemoglobin >5.3 g/dL, and

Reticulocytes ≥95,000/mm^3 if the hemoglobin concentration is <9 g/dL

Toxic range:

Neutrophils <2000 cells/mm^3

Platelets <80,000/mm^3

Hemoglobin <4.5 g/dL

Reticulocytes <80,000/mm^3 if the hemoglobin concentration is <9 g/dL

Monitor for toxicity every 2 weeks; if toxicity occurs, stop treatment until the bone marrow recovers; restart at 2.5 mg/kg/day less than the dose at which toxicity occurs; if no toxicity occurs over the next 12 weeks, then the subsequent dose should be increased by 2.5 mg/kg/day; reduced dosage of hydroxyurea alternating with erythropoietin may decrease myelotoxicity and increase levels of fetal hemoglobin in patients who have not been helped by hydroxyurea alone

Dosing: Combination Regimens

Brain tumors: 8 in 1 (Brain Tumors)

Gestational trophoblastic tumor:

CHAMOCA (Modified Bagshawe Regimen)

CHAMOMA (Bagshawe Regimen)

Head and neck cancer: FU HURT

Neuroblastoma: N4SE Protocol

Retinoblastoma: 8 in 1 (Retinoblastoma)

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralCapsules may be opened and emptied into water (will not dissolve completely); observe proper handling procedures

Dietary ConsiderationsIn sickle cell patients, supplemental administration of folic acid is recommended; hydroxyurea may mask development of folic acid deficiency.

StorageStore at room temperature between 15°C and 30°C (59°F and 86°F).

ContraindicationsHypersensitivity to hydroxyurea or any component of the formulation; severe anemia; severe bone marrow suppression;

WBC <2500/mm^3 or platelet count <100,000/mm^3 (neutrophils <2000/mm^3, platelets <80,000/mm^3, and hemoglobin <4.5 g/dL for sickle cell anemia); pregnancy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Leukemia (secondary): See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: May occur, but more likely in patients with a history of prior cytotoxic chemotherapy and radiation therapy
- Cutaneous vasculitic toxicities (vasculitic ulceration and gangrene): Have been reported with hydroxyurea treatment, most often in patients with a history of or receiving concurrent interferon therapy; discontinue hydroxyurea and consider alternate cytoreductive therapy if cutaneous vasculitic toxicity develops.
- Leukemia (secondary): **[U.S. Boxed Warning]: Hydroxyurea is mutagenic and clastogenic. Treatment of myeloproliferative disorders (polycythemia vera and thrombocythemia) with long-term hydroxyurea is associated with secondary leukemia**; it is unknown if this is drug-related or disease-related.
- Megaloblastic erythropoiesis: May be seen early in treatment; plasma iron clearance may be delayed and the rate of utilization of iron by erythrocytes may be delayed.

Disease-related issues:

- Renal impairment: Use with caution in patients with renal impairment; may require dose reductions.

Special populations:

- HIV-infected patients: When treated with hydroxyurea and antiretroviral agents (including didanosine) HIV-infected patients are at higher risk for potentially fatal pancreatitis, hepatotoxicity, hepatic failure, and severe peripheral neuropathy; discontinue immediately if signs of these develop.
- Radiation therapy recipients: Patients with a history of radiation therapy are also at risk for exacerbation of post irradiation erythema.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in cancer chemotherapy or in the treatment of sickle cell anemia.**

Geriatric ConsiderationsElderly may be more sensitive to the effects of this drug and may require a lower dosage regimen; advance dose slowly and adjust dose for renal function with careful monitoring.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and embryotoxicity. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions, breast-feeding is not recommended.

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema

Central nervous system: Chills, disorientation, dizziness, drowsiness (dose-related), fever, hallucinations, headache, malaise, seizure

Dermatologic: Alopecia (rare), cutaneous vasculitic toxicities, dermatomyositis-like skin changes, dry skin, facial erythema, gangrene, hyperpigmentation, maculopapular rash, nail atrophy, nail pigmentation, peripheral erythema, scaling, skin atrophy, skin cancer, skin ulcer, vasculitis ulcerations, violet papules

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Anorexia, constipation, diarrhea, gastrointestinal irritation and mucositis, (potentiated with radiation therapy), nausea, pancreatitis, stomatitis, vomiting

Genitourinary: Dysuria (rare)

Hematologic: Myelosuppression (primarily leukopenia; onset: 24-48 hours; nadir: 10 days; recovery: 7 days after stopping drug; reversal of WBC count occurs rapidly but the platelet count may take 7-10 days to recover); thrombocytopenia and anemia, megaloblastic erythropoiesis, macrocytosis, hemolysis, serum iron decreased, persistent cytopenias, secondary leukemias (long-term use)

Hepatic: Hepatic enzymes increased, hepatotoxicity

Neuromuscular & skeletal: Peripheral neuropathy, weakness

Renal: BUN increased, creatinine increased

Respiratory: Acute diffuse pulmonary infiltrates (rare), dyspnea, pulmonary fibrosis (rare)

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Didanosine: May enhance the adverse/toxic effect of Hydroxyurea. An increased risk of pancreatitis, hepatotoxicity and/or neuropathy may exist. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential and platelets, renal function and liver function tests, serum uric acid

Sickle cell disease: Monitor for toxicity every 2 weeks. If toxicity occurs, stop treatment until the bone marrow recovers; restart at 2.5 mg/kg/day less than the dose at which toxicity occurs. If no toxicity occurs over the next 12 weeks, then the subsequent dose should be increased by 2.5 mg/kg/day. Reduced dosage of hydroxyurea alternating with erythropoietin may decrease myelotoxicity and increase levels of fetal hemoglobin in patients who have not been helped by hydroxyurea alone.

Acceptable range: Neutrophils ≥2500 cells/mm^3, platelets ≥95,000/mm^3, hemoglobin >5.3 g/dL, and reticulocytes ≥95,000/mm^3 if the hemoglobin concentration is <9 g/dL

Toxic range: Neutrophils <2000 cells/mm^3, platelets <80,000/mm^3, hemoglobin <4.5 g/dL, and reticulocytes <80,000/mm^3 if the hemoglobin concentration is <9 g/dL

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (eg, potential for increased neurotoxicity or hepatotoxicity). Hydroxyurea therapy requires close supervision to assess results of laboratory tests (eg, CBC, renal function and LFTs), therapeutic effectiveness, and adverse response (eg, CNS changes, gastrointestinal upset. hepatotoxicity, peripheral neuropathy). Teach proper use and need for frequent monitoring, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelets, renal function and liver function tests, serum uric acid

Sickle cell disease: Monitor for toxicity every 2 weeks. If toxicity occurs, stop treatment until the bone marrow recovers; restart at 2.5 mg/kg/day less than the dose at which toxicity occurs. If no toxicity occurs over the next 12 weeks, then the subsequent dose should be increased by 2.5 mg/kg/day. Reduced dosage of hydroxyurea alternating with erythropoietin may decrease myelotoxicity and increase levels of fetal hemoglobin in patients who have not been helped by hydroxyurea alone.

Acceptable range: Neutrophils ≥2500 cells/mm^3, platelets ≥95,000/mm^3, hemoglobin >5.3 g/dL, and reticulocytes ≥95,000/mm^3 if the hemoglobin concentration is <9 g/dL

Toxic range: Neutrophils <2000 cells/mm^3, platelets <80,000/mm^3, hemoglobin <4.5 g/dL, and reticulocytes <80,000/mm^3 if the hemoglobin concentration is <9 g/dL

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take capsules exactly as directed by prescriber (dosage and timing will be specific to purpose of therapy). Contents of capsule may be emptied into a glass of water and taken immediately. You will require frequent monitoring and blood tests while taking this medication to assess effectiveness and monitor adverse reactions. You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluid, fruit, or fiber may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or mouth sores (frequent mouth care will help). Report persistent vomiting, diarrhea, constipation, stomach pain, or mouth sores; skin rash, redness, irritation, or sores; painful or difficult urination; anemia (unusual fatigue, lethargy), CNS changes (increased confusion, depression, hallucinations, or seizures); opportunistic infection (persistent fever or chills, white plaques in mouth, vaginal discharge, or unhealed sores); unusual lassitude, muscle tremors or weakness; easy bruising/bleeding; or blood in vomitus, stool, or urine. **Note:** People not taking hydroxyurea should not be exposed to it. If powder from capsule is spilled, wipe up with damp, disposable towel immediately, and discard the towel in a closed container, such as a plastic bag. Wash hands thoroughly. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 500 mg

Droxia®: 200 mg, 300 mg, 400 mg

Hydrea®: 500 mg

Tablet:

Mylocel™: 1000 mg

Generic AvailableYes: Capsule

Pricing: U.S. (www.drugstore.com)

Capsules (Droxia)

300 mg (30): $28.99

Capsules (Hydrea)

500 mg (100): $139.09

Capsules (Hydroxyurea)

500 mg (100): $89.99

Mechanism of ActionThought to interfere (unsubstantiated hypothesis) with synthesis of DNA, during the S phase of cell division, without interfering with RNA synthesis; inhibits ribonucleoside diphosphate reductase, preventing conversion of ribonucleotides to deoxyribonucleotides; cell-cycle specific for the S phase and may hold other cells in the G_1 phase of the cell cycle. In sickle cell anemia, hydroxyurea increases red blood cell (RBC) hemoglobin F levels, RBC water content, deformability of sickled cells, and alters adhesion of RBCs to endothelium.

Pharmacodynamics/Kinetics

Absorption: Readily (≥80%)

Distribution: Readily crosses blood-brain barrier; distributes into intestine, brain, lung, kidney tissues, effusions and ascites

Metabolism: 60% via hepatic and GI tract

Half-life elimination: 3-4 hours

Time to peak: 1-4 hours

Excretion: Urine (80%, 50% as unchanged drug, 30% as urea); exhaled gases (as CO_2)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsAlthough I.V. use is reported, no parenteral product is commercially available in the U.S.

If WBC decreases to $<2500/mm^3$ or platelet count to $<100,000/mm^3$ (neutrophils $<2000/mm^3$ and platelets $<80,000/mm^3$ for patients with sickle cell anemia), interrupt therapy until values rise significantly toward normal. Treat anemia with whole blood replacement; do not interrupt therapy (for sickle cell anemia patients, withhold treatment for hemoglobin <4.5 g/dL until recovery to >5.3 g/dL). Adequate trial period to determine the antineoplastic effectiveness is 6 weeks. Almost all patients receiving hydroxyurea in clinical trials needed to have their medication stopped for a time to allow their low blood count to return to acceptable levels.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may rarely cause disorientation and hallucinations

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; use caution with clozapine and carbamazepine

Index TermsHydroxycarbamide

<6 years: 50 mg daily in divided doses

≥6 years: 50-100 mg daily in divided doses

Dosing: Hepatic ImpairmentChange dosing interval to every 24 hours in patients with primary biliary cirrhosis.
Administration: I.M.Do not administer SubQ or intra-arterially. Administer I.M. deep in large muscle.
Administration: I.V.Extravasation can result in sterile abscess and marked tissue induration.
Administration: I.V. DetailpH: 3.5-6.0
StorageInjection: Store at 15°C to 30°C. Protect from light.
Compatibility**Compatibility in syringe: Compatible:** Atropine, atropine with meperidine, butorphanol, chlorpromazine, cimetidine, codeine, diphenhydramine, doxapram, droperidol, fentanyl, fluphenazine, glycopyrrolate, hydromorphone, lidocaine, meperidine, methotrimeprazine, metoclopramide, midazolam, morphine, nalbuphine, oxymorphone, pentazocine, perphenazine, procaine, prochlorperazine edisylate, promazine, promethazine, scopolamine, sufentanil. **Incompatible:** Dimenhydrinate, haloperidol, ketorolac, pentobarbital, ranitidine.
ContraindicationsHypersensitivity to hydroxyzine or any component of the formulation; early pregnancy; SubQ, intra-arterial, or I.V. administration of injection
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Respiratory disease: Use with caution in patients with asthma or COPD.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Anticholinergic effects are not well tolerated in the elderly; may be useful as a short-term antipruritic, but it is not recommended for use as a sedative or anxiolytic in the this population.

Other warnings/precautions:

- Appropriate administration: I.V., SubQ, and intra-arterial administration are contraindicated since tissue damage, intravascular hemolysis, thrombosis, and digital gangrene can occur.

Geriatric ConsiderationsAnticholinergic effects are not well tolerated in the elderly and frequently result in bowel, bladder, and mental status changes (ie, constipation, confusion, and urinary retention). Hydroxyzine may be useful as a short-term antipruritic, but it is not recommended for use as a sedative or anxiolytic in the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsHydroxyzine-induced fetal abnormalities at high dosages in animal studies. Neonatal withdrawal symptoms have been reported following long-term maternal use or the use of large doses near term. Use in early pregnancy is contraindicated by the manufacturer.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, drowsiness, fatigue, hallucination, headache, nervousness, seizure

Dermatologic: Pruritus, rash, urticaria

Gastrointestinal: Xerostomia

Neuromuscular & skeletal: Involuntary movements, paresthesia, tremor

Ocular: Blurred vision

Respiratory: Thickening of bronchial secretions

Miscellaneous: Allergic reaction

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRelief of symptoms, mental status, blood pressure

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and possible interactions. **Systemic:** Monitor therapeutic effectiveness and adverse reactions; ensure patient safety (institute safety precautions), have patient void prior to administration; and ensure adequate hydration and environmental temperature control. **Oral:** Monitor therapeutic effectiveness according to purpose for use and adverse reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationWill cause drowsiness. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Use caution when driving or engaging in activities requiring alertness until response to drug is known. Report hallucinations, seizure activity, tremors or involuntary movements, or loss of sensation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is contraindicated.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, as pamoate: 25 mg, 50 mg, 100 mg

Vistaril®: 25 mg, 50 mg

Injection, solution, as hydrochloride: 25 mg/mL (1 mL); 50 mg/mL (1 mL, 2 mL, 10 mL)

Suspension, oral, as pamoate:

Vistaril®: 25 mg/5 mL (120 mL, 480 mL) [lemon flavor] [DSC]

Syrup, as hydrochloride: 10 mg/5 mL (120 mL, 480 mL)

Tablet, as hydrochloride: 10 mg, 25 mg, 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (HydrOXYzine Pamoate)

25 mg (60): $14.98

50 mg (90): $19.00

100 mg (30): $19.99

Capsules (Vistaril)

25 mg (30): $48.29

50 mg (30): $59.84

Solution (HydrOXYzine HCl)

50 mg/mL (25): $44.38

Suspension (Vistaril)

25 mg/5 mL (240): $102.98

Tablets (HydrOXYzine HCl)

10 mg (30): $17.99

50 mg (30): $30.99

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract. Possesses skeletal muscle relaxing, bronchodilator, antihistamine, antiemetic, and analgesic properties.

Pharmacodynamics/Kinetics

Onset of action: Oral: 15-30 minutes

Duration: 4-6 hours

Absorption: Oral: Rapid

Metabolism: Forms metabolites

Half-life elimination: 3-7 hours

Time to peak: ~2 hours

Excretion: Urine

Related Information

- CMS: Long-Term Care Facility Thresholds
- Nonbenzodiazepine Anxiolytics and Hypnotics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentCommonly used as an anxiolytic, especially in individuals with a history of or active substance use. Postmarketing experience revealed cases of headache and hallucinations.

Medication Safety Issues

Sound-alike/look-alike issues:

Donnatal® may be confused with Donnagel®

Pronunciation(hye oh SYE a meen, A troe peen, skoe POL a meen, & fee noe BAR bi tal)

U.S. Brand NamesDonnatal Extentabs®; Donnatal®

Pharmacologic CategoryAnticholinergic Agent; Antispasmodic Agent, Gastrointestinal

Use: Labeled IndicationsAdjunct in treatment of irritable bowel syndrome, acute enterocolitis, duodenal ulcer

Dosing: AdultsSpasmolytic: Oral:

Donnatal®: 1-2 tablets or 5-10 mL of elixir 3-4 times/day

Donnatal Extentabs®: 1 tablet every 12 hours; may increase to 1 tablet every 8 hours if needed

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricOral: Donnatal® elixir: To be given every 4-6 hours; initial dose based on weight:

4.5 kg: 0.5 mL every 4 hours **or** 0.75 mL every 6 hours

10 kg: 1 mL every 4 hours **or** 1.5 mL every 6 hours

14 kg: 1.5 mL every 4 hours **or** 2 mL every 6 hours

23 kg: 2.5 mL every 4 hours **or** 3.8 mL every 6 hours

34 kg: 3.8 mL every 4 hours **or** 5 mL every 6 hours

≥45 kg: 5 mL every 4 hours **or** 7.5 mL every 6 hours

Administration: OralDo not crush extended release tablets.

Dietary ConsiderationsShould be taken 30-60 minutes before meals unless otherwise directed.

ContraindicationsHypersensitivity to hyoscyamine, atropine, scopolamine, phenobarbital, or any component of the formulation; narrow-angle glaucoma; tachycardia; GI and GU obstruction; myasthenia gravis; paralytic ileus; intestinal atony; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; hiatal hernia associated with reflux esophagitis; acute intermittent porphyria

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity
- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Gastric ulcer treatment: Use of anticholinergics in gastric ulcer treatment may cause a delay in gastric emptying due to antral statis.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to adverse effects.

Other warnings/precautions:

- Withdrawal: Due to the phenobarbital component should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsBecause of the anticholinergic effects of this product, it is not recommended for use in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies with this combination have not been done; refer to individual components.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Dizziness, drowsiness, headache, insomnia, nervousness

Dermatologic: Urticaria

Gastrointestinal: Bloating, constipation, nausea, taste loss, vomiting, xerostomia

Genitourinary: Impotence, urinary hesitancy, urinary retention

Neuromuscular & skeletal: Musculoskeletal pain, weakness

Ocular: Blurred vision, cycloplegia, mydriasis, ocular tension increased

Miscellaneous: Allergic reaction (may be severe), anaphylaxis, lactation suppressed, diaphoresis decreased

Metabolism/Transport EffectsPhenobarbital: **Substrate** (minor) of CYP2C8/9, 2C19, 2E1; **Induces** CYP1A2 (strong), 2A6 (strong), 2B6 (strong), 2C8/9 (strong), 3A4 (strong)
Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Aminocamptothecin: PHENobarbital may decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Amphetamines: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: PHENobarbital may decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Etravirine: PHENobarbital may decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination *Risk X: Avoid combination*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Folic Acid: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Lacosamide: PHENobarbital may decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Leucovorin-Levoleucovorin: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Methylfolate: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: PHENobarbital may decrease the serum concentration of OXcarbazepine. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Rufinamide: May increase the serum concentration of PHENobarbital. PHENobarbital may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tipranavir: PHENobarbital may decrease the serum concentration of Tipranavir. Tipranavir may decrease the serum concentration of PHENobarbital. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir:

Donnatal®: Hyoscyamine sulfate 0.1037 mg, atropine sulfate 0.0194 mg, scopolamine hydrobromide 0.0065 mg, and phenobarbital 16.2 mg per 5 mL (120 mL, 480 mL) [contains alcohol 95%; grape flavor]

Tablet: Hyoscyamine sulfate 0.1037 mg, atropine sulfate 0.0194 mg, scopolamine hydrobromide 0.0065 mg, and phenobarbital 16.2 mg

Donnatal®: Hyoscyamine sulfate 0.1037 mg, atropine sulfate 0.0194 mg, scopolamine hydrobromide 0.0065 mg, and phenobarbital 16.2 mg

Tablet, extended release:

Donnatal Extentabs®: Hyoscyamine sulfate 0.3111 mg, atropine sulfate 0.0582 mg, scopolamine hydrobromide 0.0195 mg, and phenobarbital 48.6 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Elixir (Belladonna Alk-Phenobarbital)

16 mg/5 mL (473): $56.00

Elixir (Donnatal)

16.2 mg/5 mL (120): $34.99

Tablet, controlled release (Donnatal Extentabs)

(30): $49.21

Tablets (Belladonna Alk-Phenobarbital)

16.2 mg (60): $12.99

Tablets (Donnatal)

(60): $38.51

Mechanism of ActionA fixed combination of belladonna alkaloids and phenobarbital which provides anticholinergic/antispasmodic action and mild sedation.

Related Information

- Atropine
- Hyoscyamine
- PHENobarbital
- Scopolamine Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause confusion, drowsiness, headache, loss of memory, fatigue, ataxia

Mental Health: Effects on Psychiatric TreatmentAnticholinergic effects are common and may be increased with concurrent psychotropic use

Medication Safety Issues

Sound-alike/look-alike issues:

Anaspaz® may be confused with Anaprox®, Antispas®

Levbid® may be confused with Lithobid®, Lopid®, Lorabid®

Levsinex® may be confused with Lanoxin®

Levsin/SL® maybe confused with Levaquin®

Pronunciation(hye oh SYE a meen)
U.S. Brand NamesAnaspaz®; Cystospaz®; Hyosyne; Levbid®; Levsin®; Levsin®/SL; NuLev™ [DSC]; Spacol T/S [DSC]; Spacol [DSC]; Symax SL; Symax SR
Canadian Brand NamesCystospaz®; Levsin®
Pharmacologic CategoryAnticholinergic Agent
Use: Labeled Indications

Oral: Adjunctive therapy for peptic ulcers, irritable bowel, neurogenic bladder/bowel; treatment of infant colic, GI tract disorders caused by spasm; to reduce rigidity, tremors, sialorrhea, and hyperhidrosis associated with parkinsonism; as a drying agent in acute rhinitis

Injection: Preoperative antimuscarinic to reduce secretions and block cardiac vagal inhibitory reflexes; to improve radiologic visibility of the kidneys; symptomatic relief of biliary and renal colic; reduce GI motility to facilitate diagnostic procedures (ie, endoscopy, hypotonic duodenography); reduce pain and hypersecretion in pancreatitis, certain cases of partial heart block associated with vagal activity; reversal of neuromuscular blockade

Dosing: Adults

Gastrointestinal spasms:

Oral or S.L.: 0.125-0.25 mg every 4 hours or as needed (before meals or food); maximum: 1.5 mg/24 hours

Product-specific dosing: Cystospaz®: 0.15-0.3 mg up to 4 times/day

Oral, timed release: 0.375-0.75 mg every 12 hours; maximum: 1.5 mg/24 hours

I.M., I.V., SubQ: 0.25-0.5 mg; may repeat as needed up to 4 times/day, at 4-hour intervals

Diagnostic procedures: I.V.: 0.25-0.5 mg given 5-10 minutes prior to procedure

Preanesthesia: I.V.: 5 mcg/kg given 30-60 minutes prior to induction of anesthesia or at the time preoperative narcotics or sedatives are administered

To reduce drug-induced bradycardia during surgery: I.V.: 0.125 mg; repeat as needed

Reverse neuromuscular blockade: I.V.: 0.2 mg for every 1 mg neostigmine (or the physostigmine/pyridostigmine equivalent)

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Gastrointestinal disorders:

Children <2 years: Oral: Dose as listed, based on age and weight (kg) using the 0.125 mg/mL drops. Repeat dose every 4 hours as needed:

3.4 kg: 4 drops; maximum: 24 drops/24 hours

5 kg: 5 drops; maximum: 30 drops/24 hours

7 kg: 6 drops; maximum: 36 drops/24 hours

10 kg: 8 drops; maximum: 48 drops/24 hours

Children 2-12 years: Oral or S.L.: Dose as listed, based on age and weight (kg); repeat dose every 4 hours as needed:

10 kg: 0.031-0.033 mg; maximum: 0.75 mg/24 hours

20 kg: 0.0625 mg; maximum: 0.75 mg/24 hours

40 kg: 0.0938 mg; maximum: 0.75 mg/24 hours

50 kg: 0.125 mg; maximum: 0.75 mg/24 hours

Preanesthesia: Children >2 years: I.V.: Refer to adult dosing.

Administration: I.M.May be administered without dilution.
Administration: I.V.Inject over at least 1 minute. May be administered without dilution.
Administration: I.V. DetailMay be administered undiluted.
Administration: OralOral: Tablets should be administered before meals or food.

Levbid®: Tablets are scored and may be broken in half for dose titration; do not crush or chew.

Levsin/SL®: Tablets may be used sublingually, chewed, or swallowed whole.

NuLev™: Tablet is placed on tongue and allowed to disintegrate before swallowing; may take with or without water.

Symax SL: Tablets may be used sublingually or swallowed whole.

Dietary ConsiderationsShould be taken before meals or food; NuLev™ contains phenylalanine
StorageStore at controlled room temperature. Protect NuLev™ from moisture.
ContraindicationsHypersensitivity to belladonna alkaloids or any component of the formulation; glaucoma; obstructive uropathy; myasthenia gravis; obstructive GI tract disease, paralytic ileus, intestinal atony of elderly or debilitated patients, severe ulcerative colitis, toxic megacolon complicating ulcerative colitis; unstable cardiovascular status in acute hemorrhage, myocardial ischemia
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effect:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.
- Psychosis: Has been reported in patients with an extreme sensitivity to anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Hiatal hernia: Use with caution in patients with hiatal hernia with reflux esophagitis.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to adverse effects. May precipitate undiagnosed glaucoma and/or severely impair memory function (especially in those patients with previous memory problems).
- Pediatrics: Use with caution in children with spastic paralysis.

Dosage form specific issues:

- Phenylalanine: NuLev™ contains phenylalanine.

Geriatric ConsiderationsAvoid long-term use; the potential for toxic reactions is higher than the potential benefit, elderly are particularly prone to CNS side effects of anticholinergics (eg, confusion, delirium, hallucinations). Side effects often occur before clinical response is obtained.
Pregnancy Risk FactorC
Pregnancy ConsiderationsCrosses the placenta, effects to the fetus not known; use during pregnancy only if clearly needed.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsExcreted in breast milk in trace amounts. May also suppress lactation. Breast-feeding is not recommended.
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Ataxia, dizziness, drowsiness, headache, insomnia, mental confusion/excitement, nervousness, speech disorder

Dermatologic: Urticaria

Endocrine & metabolic: Lactation suppression

Gastrointestinal: Bloating, constipation, dry mouth, loss of taste, nausea, vomiting

Genitourinary: Impotence, urinary hesitancy, urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, cycloplegia, increased ocular tension, mydriasis

Miscellaneous: Allergic reactions, sweating decreased

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, anything that may add to anticholinergic effects). **I.V./I.M.:** Have patient void before administration. Assess therapeutic effectiveness and adverse response (eg, excessive dryness of eyes, nose, mouth, or throat). Teach patient proper use (according to formulations prescribed), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed before meals; do not increase dose and do not discontinue without consulting prescriber. Void immediately before taking medication. Do not crush or chew (swallow whole) extended release form. Levbid® and Levsinex® may not completely disintegrate and may be excreted. You may experience dizziness or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); dry mouth (sucking on lozenges may help); photosensitivity (wear dark glasses in bright sunlight); decreased ability to sweat (use caution in hot weather or hot rooms or when engaging in strenuous activity); or impotence (temporary). Report excessive and persistent anticholinergic effects (blurred vision, headache, flushing, tachycardia, nervousness, constipation, dizziness, insomnia, mental confusion or excitement, dry mouth, altered taste perception, dysphagia, palpitations, bradycardia, urinary hesitancy or retention, impotence, decreased sweating). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Sublingual tablets: Place tablet under tongue and allow to dissolve.

Orally-disintegrating tablet: Place tablet on tongue and allow to disintegrate before swallowing. Take with or without food.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, timed release, as sulfate: 0.375 mg

Elixir, as sulfate: 0.125 mg/5 mL (480 mL)

Hyosyne: 0.125 mg/5 mL (480 mL) [contains ethanol 20% and sodium benzoate; orange flavor]

Levsin®: 0.125 mg/5 mL (480 mL) [contains ethanol 20%; orange flavor]

Injection, solution, as sulfate: 0.5 mg/mL (1 mL)

Levsin®: 0.5 mg/mL (1 mL)

Solution, oral, as sulfate [drops]: 0.125 mg/mL (15 mL)

Hyosyne: 0.125 mg/mL (15 mL) [contains ethanol 5% and sodium benzoate; orange flavor]

Levsin®: 0.125 mg/mL (15 mL) [contains ethanol 5%; orange flavor]

Tablet:

Cystospaz®: 0.15 mg [DSC]

Tablet, as sulfate: 0.125 mg

Anaspaz®: 0.125 mg

Levsin®: 0.125 mg

Tablet, extended release, as sulfate: 0.375 mg

Levbid®: 0.375 mg

Symax SR: 0.375 mg

Tablet, orally disintegrating, as sulfate: 0.125 mg

NuLev™: 0.125 mg [contains phenylalanine 1.7 mg/tablet, mint flavor] [DSC]

Tablet, sublingual, as sulfate: 0.125 mg

Levsin®/SL: 0.125 mg

Symax SL: 0.125 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Hyoscyamine Sulfate CR)

0.375 mg (100): $85.99

Elixir (Levsin)

0.125 mg/5 mL (150): $42.99

Solution (Levsin)

0.125 mg/mL (15): $44.09

Sublingual (Levsin/SL)

0.125 mg (100): $107.79

Sublingual (Symax-SL)

0.125 mg (30): $75.92

Tablet, 12-hour (Hyoscyamine Sulfate CR)

0.375 mg (30): $29.99

Tablet, 12-hour (Levbid)

0.375 mg (30): $54.99

Tablets (Anaspaz)

0.125 mg (100): $29.99

Tablets (Hyoscyamine Sulfate)

0.125 mg (90): $49.99

Mechanism of ActionBlocks the action of acetylcholine at parasympathetic sites in smooth muscle, secretory glands and the CNS; increases cardiac output, dries secretions, antagonizes histamine and serotonin
Pharmacodynamics/Kinetics

Onset of action: 2-3 minutes

Duration: 4-6 hours

Absorption: Well absorbed

Distribution: Crosses placenta; small amounts enter breast milk

Protein binding: 50%

Metabolism: Hepatic

Half-life elimination: 3-5 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness; may rarely cause restlessness, amnesia, or delirium
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation and dry mouth
Index Terms/-Hyoscyamine Sulfate; Hyoscyamine Sulfate

Jump To Field (Select Field Name)

Pharmacologic CategoryChemotherapy Regimen, Leukemia, Acute Lymphocytic

Regimen UseLeukemia, acute lymphocytic

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cycle A: (Cycles 1, 3, 5, and 7)

Cyclophosphamide: I.V.: 300 mg/m^2 every 12 hours, for 6 doses, days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Mesna: I.V.: 1200 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 3600 mg/m^2]

Vincristine: I.V.: 2 mg/day days 4 and 11

[total dose/cycle = 4 mg]

Doxorubicin: I.V.: 50 mg/m^2 day 4

[total dose/cycle = 50 mg/m^2]

Dexamethasone: (route not specified): 40 mg/day days 1, 2, 3, 4, 11, 12, 13, and 14

[total dose/cycle = 320 mg]

Cycle B: (Cycles 2, 4, 6, and 8)

Methotrexate: I.V.: 1 g/m^2 continuous infusion day 1

[total dose/cycle = 1g/m^2]

Leucovorin: (route not specified): 15 mg every 6 hours, for 8 doses (start 12 hours after end of methotrexate infusion)

[total dose/cycle = 120 mg]

Cytarabine: I.V.: 3 g/m^2 every 12 hours, for 4 doses, days 2 and 3

[total dose/cycle = 12 g/m^2]

Methylprednisolone: I.V.: 50 mg twice daily, for 6 doses, days 1, 2, and 3

[total dose/cycle = 300 mg/m^2]

Repeat every 6 weeks in the following sequence: ABABABAB

CNS Prophylaxis

Methotrexate: I.T.: 12 mg/day day 2

[total dose/cycle = 12 mg]

or 6 mg/day into Ommaya day 2

[total dose/cycle = 6 mg]

Cytarabine: I.T: 100 mg day 8

[total dose/cycle = 100 mg]

Repeat cycle every 3 weeks

Maintenance (POMP)

Mercaptopurine: Oral: 50 mg 3 times/day

[total dose/cycle = 4200-4650 mg]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: Oral: 20 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 80 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

or

Mercaptopurine: I.V.: 1 g/m^2/day days 1 to 5

[total dose/cycle = 5 g/m^2]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: I.V.: 10 mg/m^2/day days 1 to 5

[total dose/cycle = 50 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Repeat cycles every month for 2 years

Variation 2:

Cycle A: (Cycles 1, 3, 5, and 7)

Cyclophosphamide: I.V.: 300 mg/m^2 every 12 hours, for 6 doses, days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Mesna: I.V.: 600 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Vincristine: I.V.: 2 mg/day days 4 and 11

[total dose/cycle = 4 mg]

Doxorubicin: I.V.: 50 mg/m^2 day 4

[total dose/cycle = 50 mg/m^2]

Dexamethasone: Oral, I.V.: 40 mg/day days 1, 2, 3, 4, 11, 12, 13, and 14

[total dose/cycle = 320 mg]

Cycle B: (Cycles 2, 4, 6, and 8)

Methotrexate: I.V.: 1 g/m^2 continuous infusion day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: I.V.: 50 mg (start 12 hours after end of methotrexate infusion)

followed by I.V.: 15 mg every 6 hours, for 8 doses

[total dose/cycle = 170 mg]

Cytarabine: I.V.: 3 g/m^2 every 12 hours, for 4 doses, days 2 and 3

[total dose/cycle = 12 g/m^2]

Repeat every 6 weeks in the following sequence: ABABABAB

CNS Prophylaxis

Methotrexate: I.T.: 12 mg day 2

[total dose/cycle = 12 mg]

or 6 mg into Ommaya day 2

[total dose/cycle = 6 mg]

Cytarabine: I.T.: 100 mg day 7

[total dose/cycle = 100 mg]

Repeat cycle every 3 weeks

Variation 3:

Cycle A: (Cycles 1, 3, 5, and 7)

Cyclophosphamide: I.V.: 300 mg/m^2 every 12 hours, for 6 doses, days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Mesna: I.V.: 600 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Vincristine: I.V.: 2 mg/day days 4 and 11

[total dose/cycle = 4 mg]

Doxorubicin: I.V.: 50 mg/m^2 continuous infusion day 4

[total dose/cycle = 50 mg/m^2]

Dexamethasone: Oral, I.V.: 40 mg/day days 1, 2, 3, 4, 11, 12, 13, and 14

[total dose/cycle = 320 mg]

Cycle B: (Cycles 2, 4, 6, and 8)

Methotrexate: I.V.: 200 mg/m^2 day 1

followed by I.V.: 800 mg/m^2 continuous infusion day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: I.V.: 50 mg (start 12 hours after end of methotrexate infusion)

followed by I.V.: 15 mg every 6 hours, for 8 doses

[total dose/cycle = 170 mg/m^2]

Cytarabine: I.V.: 3 g/m^2 every 12 hours, for 4 doses, days 2 and 3

[total dose/cycle = 12 g/m^2]

Repeat every 6 weeks in the following sequence: ABABABAB

CNS Prophylaxis

Methotrexate: I.T.: 12 mg day 2

[total dose/cycle = 12 mg]

or 6 mg into Ommaya day 2

[total dose/cycle = 6 mg]

Cytarabine: I.T.: 100 mg day 7 **or** 8

[total dose/cycle = 100 mg]

Repeat cycles every 3 weeks for 6 or 8 cycles

Maintenance (POMP)

Mercaptopurine: Oral: 50 mg 3 times/day

[total dose/cycle = 4200-4650 mg]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: Oral, I V: 20 mg/m^2/ day days 1, 8, 15, and 22

[total dose/cycle = 80 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

or

Mercaptopurine: I.V.: 1 g/m^2/day days 1 to 5

[total dose/cycle = 5 g/m^2]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: I.V.: 10 mg/m^2 /day days 1 to 5

[total dose/cycle = 50 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg]

Repeat cycles every month (except months 7 and 11 or 9 and 12) for 2 years

Intensification

Etoposide: I.V.: 100 mg/m^2/day days 1 to 5

[total dose/cycle = 500 mg/m^2]

Pegaspargase: I.V.: 2500 units/m^2 day 1

[total dose/cycle = 2500 units/m^2]

Given during months 9 and 12 of maintenance

or

Methotrexate: I.V.: 100 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 400 mg/m^2]

Asparaginase: I.V.: 20,000 units/day days 2, 9, 16, and 23

[total dose/cycle = 80,000 units]

Given during months 7 and 11 of maintenance

Variation 4:

Cycle A: (Cycles 1, 3, 5, and 7)

Cyclophosphamide: I.V.: 300 mg/m^2 every 12 hours, for 6 doses, days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Mesna: I.V.: 600 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Vincristine: I.V.: 2 mg/day days 4 and 11

[total dose/cycle = 4 mg]

Doxorubicin: I.V.: 50 mg/m^2day 4

[total dose/cycle = 50 mg/m^2]

Dexamethasone: (route not specified): 40 mg/day days 1, 2, 3, 4, 11, 12, 13, and 14

[total dose/cycle = 320 mg]

Cycle B: (Cycles 2, 4, 6, and 8)

Methotrexate: I.V.: 200 mg/m^2 day 1

followed by I.V.: 800 mg/m^2 continuous infusion day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: (route not specified): 15 mg every 6 hours, for 8 doses (start 24 hours after end of methotrexate infusion)

[total dose/cycle = 120 mg]

Cytarabine: I.V.: 3 g/m^2 every 12 hours, for 4 doses, days 2 and 3

[total dose/cycle = 12 g/m^2]

Repeat every 6 weeks in the following sequence: ABABABAB

CNS Prophylaxis

Methotrexate: I.T.: 12 mg day 2

[total dose/cycle = 12 mg]

Cytarabine: I.T.: 100 mg day 8

[total dose/cycle = 100 mg]

Repeat cycle every 3 weeks for 4 or 8 cycles

Maintenance (POMP)

Mercaptopurine: Oral: 50 mg 3 times/day

[total dose/cycle = 4200-4650 mg]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: Oral: 20 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 80 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

or

Mercaptopurine: I.V.: 1 g/m^2/day days 1 to 5

[total dose/cycle = 5 g/m^2]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: I.V.: 10 mg/m^2/day days 1 to 5

[total dose/cycle = 50 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

or

Interferon alfa: SubQ: 5 million units/m^2 daily

[total dose/cycle = 140-155 million units/m^2]

Cytarabine: SubQ: 10 mg daily

[total dose/cycle = 280-310 mg]

Repeat cycles every month for 2 years

Variation 5:

Cycle A: (Cycles 1, 4, 6, and 8)

Cyclophosphamide: I.V.: 300 mg/m^2 every 12 hours, for 6 doses, days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Mesna: I.V.: 600 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Vincristine: I.V.: 2 mg/day days 4 and 11

[total dose/cycle = 4 mg]

Doxorubicin: I.V.: 50 mg/m^2 continuous infusion day 4

[total dose/cycle = 50 mg/m^2]

Dexamethasone: Oral, I.V.: 40 mg/day days 1, 2, 3, 4, 11, 12, 13, and 14

[total dose/cycle = 320 mg]

Cycle B: (Cycles 3, 5, 7, and 9)

Methotrexate: I.V.: 200 mg/m^2 day 1

followed by I.V.: 800 mg/m^2/day continuous infusion day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: I.V.: 50 mg (start 12 hours after end of methotrexate infusion)

followed by I.V.: 15 mg every 6 hours, for 8 doses

[total dose/cycle = 170 mg]

Cytarabine: I.V.: 3 g/m ^{2} every 12 hours, for 4 doses, days 2 and 3

[total dose/cycle = 12 g/m^2]

Cycle C: Liposomal Daunorubicin/cytarabine (Cycle 2):

Daunorubicin, liposomal: I.V.: 150 mg/m^2/day days 1 and 2

[total dose/cycle = 300 mg/m^2]

Cytarabine: I.V.: 1.5 g/m^2/day continuous infusion days 1 and 2

[total dose/cycle = 3 g/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg]

Administer in the following sequence: ACBABABA (Cycle C does not repeat)

CNS Prophylaxis

Methotrexate: I.T.: 12 mg day 2

[total dose/cycle = 12 mg]

or 6 mg into Ommaya day 2

[total dose/cycle = 6 mg]

Cytarabine: I.T.: 100 mg days 7 **or** 8

[total dose/cycle = 100 mg]

Repeat cycle every 3 weeks for 6 or 8 cycles

Maintenance (POMP)

Mercaptopurine: I.V.: 1 g/m^2/day days 1 to 5

[total dose/cycle = 5 g/m^2]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Methotrexate: I.V.: 10 mg/m^2/day days 1 to 5

[total dose/cycle = 50 mg/m^2]

Prednisone: Oral: 200 mg/day days 1 to 5

[total dose/cycle = 1000 mg]

Repeat cycles monthly, except months 6, 7, 18, and 19 for 3 years

Intensification

Methotrexate: I.V.: 100 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 400 mg/m^2]

Asparaginase: I.V.: 20,000 units/day days 2, 9, 16, and 23

[total dose/cycle = 80,000 units]

Given during months 6 and 18 of maintenance

Cyclophosphamide: I.V.: 300 mg/m^2 every 12 hours, for 6 doses, days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Mesna: I.V.: 600 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Vincristine: I.V.: 2 mg/day days 4 and 11

[total dose/cycle = 4 mg]

Doxorubicin: I.V.: 50 mg/m^2/day continuous infusion day 4

[total dose/cycle = 50 mg/m^2]

Dexamethasone: Oral, I.V.: 40 mg/day days 1, 2, 3, 4, 11, 12, 13, and 14

[total dose/cycle = 320 mg]

Given during months 7 and 19 of maintenance

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Pronunciation(eye BAN droh nate)

U.S. Brand NamesBoniva®

Canadian Brand NamesBondronat®

Pharmacologic CategoryBisphosphonate Derivative

Use: Labeled IndicationsTreatment and prevention of osteoporosis in postmenopausal females

Use: Unlabeled/InvestigationalHypercalcemia of malignancy; corticosteroid-induced osteoporosis; Paget's disease; reduce bone pain and skeletal complications from metastatic bone disease

Dosing: Adults

Treatment of postmenopausal osteoporosis:

Oral: 2.5 mg once daily **or** 150 mg once a month

I.V.: 3 mg every 3 months

Prevention of postmenopausal osteoporosis: Oral: 2.5 mg once daily **or** 150 mg once a month

Hypercalcemia of malignancy (unlabeled use): I.V.: 2-4 mg over 2 hours

Metastatic bone disease (unlabeled use):

Oral: 50 mg once daily

I.V.: 6 mg over 1 hour every 3-4 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild or moderate impairment: Dosing adjustment not needed.

Severe impairment (Cl_{cr} <30 mL/minute): Use not recommended.

Dosage adjustment in renal impairment for oncologic uses (unlabeled): Severe impairment (Cl_{cr} <30 mL/minute):

Oral: 50 mg once weekly

I.V.: 2 mg over 1 hour every 3-4 weeks

Dosing: Hepatic ImpairmentDosing adjustment not needed.

Calculations

- Creatinine Clearance: Adults

Administration: I.V.Administer as a 15-30 second bolus. Do not mix with calcium-containing solutions or other drugs. For osteoporosis, do not administer more frequently than every 3 months. Infuse over 1 hour for metastatic bone disease and over 2 hours for hypercalcemia of malignancy.

Administration: OralShould be administered 60 minutes before the first food or drink of the day (other than water) and prior to taking any oral medications or supplements (eg, calcium, antacids, vitamins). Ibandronate should be taken in an upright position with a full glass (6-8 oz) of plain water and the patient should avoid lying down for 60 minutes to minimize the possibility of GI side effects. Mineral water with a high calcium content should be avoided. The tablet should be swallowed whole; do not chew or suck. Do not eat or drink anything (except water) for 60 minutes following administration of ibandronate.

Once-monthly dosing: The 150 mg tablet should be taken on the same date each month. In case of a missed dose, do not take two 150 mg tablets within the same week. If the next scheduled dose is 1-7 days away, wait until the next scheduled dose to take the tablet. If the next scheduled dose is >7 days away, take the dose the morning it is remembered, and then resume taking the once-monthly dose on the originally scheduled day.

Dietary ConsiderationsSupplemental calcium or vitamin D may be required if dietary intake is not adequate; women >50 years of age should consume 1200-1500 mg/day of elemental calcium and 800-1000 int. units/day of vitamin D. Ibandronate tablet should be taken with a full glass (6-8 oz) of plain water, at least 60 minutes prior to any food, beverages, or medications. Mineral water with a high calcium content should be avoided.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to ibandronate or any component of the formulation; hypocalcemia; oral tablets are also contraindicated in patients unable to stand or sit upright for at least 60 minutes

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Consider discontinuing therapy in patients who experience severe symptoms; symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, dysphagia, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition). Discontinue use if new or worsening symptoms develop.

- Hypocalcemia: Hypocalcemia has been reported with the use of bisphosphonates. Prior to therapy initiation, hypocalcemia must be corrected; ensure adequate calcium and vitamin D intake.

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Most reported cases occurred after I.V. bisphosphonate therapy; however, cases have been reported following oral therapy. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Renal impairment: Use not recommended with severe renal impairment (Cl_{cr} <30 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Injection: Intravenous bisphosphonates may cause transient decreases in serum calcium and have also been associated with renal toxicity.

Geriatric ConsiderationsStudies with elderly found no difference between younger adults and the elderly. No special dosage changes are necessary.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse effects were demonstrated in animal studies. There are no adequate and well-controlled studies in pregnant women. Bisphosphonates are incorporated into the bone matrix and are gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if administered during pregnancy.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPercentages vary based on frequency of administration (daily vs monthly). Unless specified, percentages are reported with oral use.

>10%:

Gastrointestinal: Dyspepsia (6% to 12%)

Neuromuscular & skeletal: Back pain (4% to 14%)

1% to 10%:

Cardiovascular: Hypertension (6% to 7%)

Central nervous system: Headache (3% to 7%), dizziness (1% to 4%), insomnia (1% to 2%)

Dermatologic: Rash (1% to 2%)

Endocrine & metabolic: Hypercholesterolemia (5%)

Gastrointestinal: Abdominal pain (5% to 8%), diarrhea (4% to 7%), nausea (5%), tooth disorder (4%), constipation (3% to 4%), vomiting (3%)

Genitourinary: Urinary tract infection (2% to 6%)

Hepatic: Alkaline phosphatase decreased (frequency not defined)

Local: Injection site reaction (<2%)

Neuromuscular & skeletal: Pain in extremity (1% to 8%), arthralgia (4% to 6%), myalgia (1% to 6%), joint disorder (4%), weakness (4%), muscle cramp (2%)

Respiratory: Bronchitis (3% to 10%), pneumonia (6%), pharyngitis/nasopharyngitis (3% to 4%), upper respiratory infection (2%)

Miscellaneous: Acute phase reaction (I.V. 10%; oral 3% to 9%), infection (4%), flu-like syndrome (1% to 4%), allergic reaction (3%)

Postmarketing and/or case reports: Anaphylaxis; angioedema; bronchospasm; hypocalcemia; incapacitating bone, joint or muscle pain; iritis; ocular inflammation; osteonecrosis of the jaw; scleritis; uveitis

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food: May reduce absorption; mean oral bioavailability is decreased up to 90% when given with food.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersBone mineral density as measured by central dual-energy x-ray absorptiometry (DXA) of the hip or spine (at least every 2 years); serum creatinine prior to each I.V. dose

Nursing: Physical Assessment/MonitoringAssess history for any previous adverse response to bisphosphonates and ability to comply with administration instructions. Use caution with renal impairment. Correct any hypocalcemia prior to beginning treatment. Patients at risk for osteonecrosis (eg, chemotherapy, corticosteroids, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. I.V.: See infusion specifics. Assess results of periodic laboratory tests, therapeutic effectiveness, and adverse reactions (eg, immediate or long-term musculoskeletal pain). Teach appropriate use and specific administration directions (oral), lifestyle and dietary changes according to purpose for use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine prior to each I.V. dose

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Oral: Take as directed, with a full glass of water first thing in the morning and at least 60 minutes before the first food or beverage of the day. Wait at least 60 minutes after taking Ibandronate before taking anything else. Stay in sitting or standing position for 60 minutes following administration and until after the first food of the day to reduce potential for esophageal irritation. Consult prescriber to determine necessity of lifestyle changes (eg, decreased smoking, decreased alcohol intake, dietary supplements of calcium or vitamin D). Certain dental procedures should be avoided if possible while you are taking this medication; consult prescriber. You may experience temporary flatulence, bloating, nausea, or acid regurgitation (small, frequent meals may help) or temporary bone pain (consult prescriber for analgesic). Report persistent muscle or bone pain; leg cramps; acute headache; persistent gastric pain or unresolved GI upset; unusual fever; chills; rash; or pain in mouth. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 1 mg/mL (3 mL) [prefilled syringe]

Tablet: 2.5 mg [once-daily formulation]; 150 mg [once-monthly formulation]

Generic AvailableNo

ManufacturerRoche Laboratories, Inc

Pricing: U.S. (www.drugstore.com)

Kit (Boniva)

3 mg/3 mL (1): $465.09

Tablets (Boniva)

150 mg (3): $306.59

Mechanism of ActionA bisphosphonate which inhibits bone resorption via actions on osteoclasts or on osteoclast precursors; decreases the rate of bone resorption, leading to an indirect increase in bone mineral density.

Pharmacodynamics/Kinetics

Distribution: Terminal V_d: 90 L; 40% to 50% of circulating ibandronate binds to bone

Protein binding: 85.7% to 99.5%

Metabolism: Not metabolized

Bioavailability: Oral: Reduced by 90% following standard breakfast

Half-life elimination:

Oral: 150 mg dose: Terminal: 37-157 hours

I.V.: Terminal: ~5-25 hours

Time to peak, plasma: Oral: 0.5-2 hours

Excretion: Urine (50% to 60% of absorbed dose, excreted as unchanged drug); feces (unabsorbed drug)

Dental Health Professional ConsiderationsCases of oral bisphosphonate-associated ONJ have been reported. A report by the Council of Scientific Affairs of the American Dental Association (accessed at: http://www.ada.org/prof/resources/topics/osteonecrosis.asp) as of July 2006 gave an estimated incidence of 0.7 cases for every 100,000 person-years of exposure to alendronate (Fosamax®). This translates to one case for every 142,857 person-years exposure. This figure from the ADA report was based on information received from Merck & Co citing 170 worldwide cases for alendronate (Fosamax®). In addition, Procter & Gamble Pharmaceuticals has cited 20 cases for risedronate (Actonel®) and Roche Laboratories has cited one case for ibandronate (Boniva®).

Consumer Reports On Health stated that the risk of jaw bone osteoporosis due to alendronate (Fosamax®), risedronate (Actonel®), or ibandronate (Boniva®) taken to prevent osteoporosis is very low and is estimated to be one out of every 20,000 users. That report mentioned that tooth extraction or implants increase the risk of developing osteonecrosis in patients taking any of these drugs for osteoporosis. The report also recommended that patients should stop taking any of these oral drugs 1-2 months before and after such dental treatment. No evidence was presented to support this statement.

In terms of length of exposure to oral bisphosphonates prior to onset of ONJ, data from large population studies or controlled studies is lacking. A report by Marx et al, observed that of three cases of ONJ associated with Fosamax® exposure, one patient had been taking 10 mg/day by mouth for 6 years and the other two patients 10 mg/day by mouth for 3 and 2 years respectively. In contrast, they observed that in cancer patients receiving intravenous bisphosphonates, the time period between the first doses of the bisphosphonate to first recognition of exposed bone either by the patients or by the clinician, was 9.4 months for zoledronate (Zometa®), 14.3 months for pamidronate (Aredia®), and 12.1 months for pamidronate then to zoledronate.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tooth disorder.

Osteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsIbandronate Sodium; Ibandronic Acid

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Dosage maximum: Do not exceed the Y-90 Ibritumomab maximum allowable dose of 32 mCi, regardless of the patient’s body weight.

Pronunciation(ib ri TYOO mo mab)

U.S. Brand NamesZevalin®

Canadian Brand NamesZevalin®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Radiopharmaceutical

Use: Labeled IndicationsTreatment of relapsed or refractory low-grade or follicular B-cell non-Hodgkin's lymphoma

Dosing: Adults**Note:** Premedication with acetaminophen and diphenhydramine is recommended for rituximab infusions.

Non-Hodgkin's lymphoma, B-cell (relapsed or refractory low-grade, follicular, or transformed): I.V.: Ibritumomab is administered **only** as part of the Zevalin® therapeutic regimen (a combined treatment regimen with rituximab). The regimen consists of two steps:

Day 1:

Rituximab infusion: 250 mg/m^2 at an initial rate of 50 mg/hour. If hypersensitivity or infusion-related events do not occur, increase infusion in increments of 50 mg/hour every 30 minutes, to a maximum of 400 mg/hour. Discontinue for severe infusion reaction. For less severe infusion reactions, temporarily slow or interrupt; the infusion may be resumed at one-half the previous rate upon improvement of symptoms.

In-111 ibritumomab infusion: Within 4 hours of the completion of rituximab infusion, inject 5 mCi (1.6 mg total antibody dose) over 10 minutes.

Note: Biodistribution of In-111 ibritumomab should be assessed by imaging at 48-72 hours postinjection. Optional additional imaging may be performed to resolve ambiguities. If biodistribution is not acceptable, the patient should not proceed to Step 2.

Day 7, 8, or 9:

Rituximab infusion: 250 mg/m^2 at an initial rate of 100 mg/hour (50 mg/hour if infusion-related events occurred with the first infusion). If hypersensitivity or infusion-related events do not occur, increase infusion in increments of 100 mg/hour every 30 minutes, to a maximum of 400 mg/hour, as tolerated.

Y-90 ibritumomab infusion: Within 4 hours of the completion of rituximab infusion:

Platelet count ≥150,000 cells/mm^3: Inject 0.4 mCi/kg (14.8 MBq/kg actual body weight) over 10 minutes; maximum dose: 32 mCi (1184 MBq)

Platelet count between 100,000-149,000 cells/mm^3: Inject 0.3 mCi/kg (11.1 MBq/kg actual body weight) over 10 minutes; maximum dose: 32 mCi (1184 MBq)

Platelet count <100,000 cells/mm^3: Do **not** administer

Maximum dose: The prescribed, measured, and administered dose of Y-90 ibritumomab must not exceed 32 mCi (1184 MBq), regardless of the patient's body weight

Dosing: ElderlyRefer to adult dosing.

Calculations

- Body Surface Area: Adults

Administration: I.V.

Rituximab: Administer the first infusion of rituximab at an initial rate of 50 mg/hour. If hypersensitivity or infusion-related events do not occur, escalate the infusion rate in 50 mg/hour increments every 30 minutes, to a maximum of 400 mg/hour. Immediately stop infusion for severe infusion reaction (discontinue ibritumomab regimen); less severe reactions may be managed by slowing or interrupting infusion. For less severe reactions, infusion may continue at one-half the previous rate upon improvement of patient symptoms. Subsequent rituximab infusion can be administered at an initial rate of 100 mg/hour and increased in 100 mg/hour increments at 30-minute intervals, to a maximum of 400 mg/hour as tolerated.

In-111 and Y-90 ibritumomab: Inject slowly, over 10 minutes through a 0.22 micron low protein binding in-line filter. After injection, flush line with at least 10 mL normal saline. Y-90 ibritumomab: establish free-flowing I.V. line prior to administration; avoid extravasation.

StorageStore at 2°C to 8°C (36°F to 46°F); do not freeze. Kit is not radioactive.
ReconstitutionTo prepare radiolabeled injection, follow detailed preparation guidelines provided by manufacturer.
ContraindicationsThere are no contraindications listed within the manufacturer's labeling.
Warnings/Precautions

Boxed warnings:

- Cutaneous/mucocutaneous reactions: See "Concerns related to adverse effects" below.
- Cytopenias: See "Concerns related to adverse effects" below.
- Infusion reactions: See "Concerns related to adverse effects" below.
- Maximum dose: See "Other warnings/precautions" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cutaneous/mucocutaneous reactions: **[U.S. Boxed Warning]: Severe cutaneous and mucocutaneous skin reactions have been reported (with fatalities) in postmarketing experience.** These include erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis, bullous dermatitis, and exfoliative dermatitis. Onset may occur within days to 3-4 months following infusion. Patients experiencing severe cutaneous or mucocutaneous skin reactions should not receive any further component of the ibritumomab regimen.
- Cytopenias: **[U.S. Boxed Warning]: Delayed, prolonged, and severe cytopenias (thrombocytopenia and neutropenia) are common. Do not administer to patients with ≥25% lymphoma marrow involvement, patients with impaired bone marrow reserve** (eg, prior myeloablative treatment, platelet count <100,000/mm^3, neutrophil count <1500/mm^3, hypocellular marrow), or to patients with prior stem cell collection failure. Hemorrhage may occur due to thrombocytopenia; use caution with patients taking anticoagulants or medications interfering with platelet function. Closely monitor patients for complications of cytopenias (eg, febrile neutropenia, hemorrhage) for up to 3 months after administration.
- Infusion reactions: **[U.S. Boxed Warning]: Severe and potentially fatal infusion reactions (angioedema, bronchospasm, hypotension, hypoxia) have been reported, typically with the first rituximab infusion** (during infusion or within 30-120 minutes of infusion). Severe reactions have also included acute respiratory distress syndrome, pulmonary infiltrates, urticaria, cardiogenic shock, MI, and ventricular fibrillation. Immediately stop infusion for severe infusion reaction; less severe reactions may be managed by slowing or interrupting infusion. Medications for the treatment of hypersensitivity reactions should be available for immediate use.
- Radiation injury: Delayed (up to 1 month) radiation injury has occurred in or near areas of lymphomatous involvement.
- Secondary malignancies: Secondary malignancies (acute myelogenous leukemia and/or myelodysplastic syndrome) have been reported; the median time to secondary malignancy diagnosis following ibritumomab treatment was 1.9 years (range: 0.4-6.3 years).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Product contains albumin, which confers a theoretical risk of transmission of viral disease or Creutzfeldt-Jakob disease.

Other warnings/precautions:

- Experienced professionals: Use should be reserved to physicians and other professionals qualified and experienced in the safe handling of radiopharmaceuticals, and in monitoring and emergency treatment of infusion reactions.
- Extravasation/radiation necrosis: Infusion site erythema and ulceration have been reported following extravasation; monitor infusion site; promptly terminate infusion with symptoms/signs of extravasation (restart in another limb). There is a case report of (delayed) erythema and ulceration, which is described as radiation necrosis following yttrium-90-ibritumomab extravasation (Williams, 2006).
- Immunizations: Do not administer live viral vaccines to patients who have recently received ibritumomab treatment. The safety of immunization with live vaccines following ibritumomab therapy has not been studied; the ability to generate a response to any vaccine after receiving treatment has not been studied.
- Maximum dose: **[U.S. Boxed Warning]: Do not exceed the Y-90 Ibritumomab maximum allowable dose of 32 mCi; do not administer to patients with altered biodistribution.** To be used as part of the Zevalin® therapeutic regimen (in combination with rituximab). Safety and efficacy of repeated courses of the therapeutic regimen have not been established.
- Radioactivity: The contents of the kit are not radioactive until radiolabeling occurs. During and after radiolabeling, adequate shielding should be used with this product, in accordance with institutional radiation safety practices.

Pregnancy Risk FactorD
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Y-90 ibritumomab may cause fetal harm. Women of childbearing potential should avoid becoming pregnant during treatment with ibritumomab. Both males and females should use effective contraception for 12 months following treatment. The effect on future fertility is unknown.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsIt is not known whether ibritumomab is excreted in breast milk; women are advised to discontinue breast-feeding and substitute with formula feedings.

Adverse ReactionsSevere, potentially life-threatening allergic reactions have occurred in association with infusions. Also refer to Rituximab monograph.

>10%:

Central nervous system: Chills (24%), fever (17%), pain (13%), headache (12%)

Gastrointestinal: Nausea (31%), abdominal pain (16%), vomiting (12%)

Hematologic: Thrombocytopenia (95%; grades 3/4: 63%; nadir: 53 days), neutropenia (77%; grades 3/4: 60%; nadir: 62 days), anemia (61%; grades 3/4: 17%; nadir: 68 days), myelosuppression (nadir: 7-9 weeks; duration: 22-35 days)

Neuromuscular & skeletal: Weakness (43%)

Respiratory: Dyspnea (14%)

Miscellaneous: Infection (29%)

1% to 10%:

Cardiovascular: Peripheral edema (8%), flushing (6%), hypotension (6%)

Central nervous system: Dizziness (10%), insomnia (5%), anxiety (4%)

Dermatologic: Pruritus (9%), rash (8%), bruising (7%), angioedema (5%; grades 3/4: <1%), urticaria (4%), petechiae (3%)

Gastrointestinal: Diarrhea (9%), anorexia (8%), abdominal distension (5%), constipation (5%), dyspepsia (4%), melena (2%; life threatening in 1%), gastrointestinal hemorrhage (severe: 1%)

Hematologic: Pancytopenia (severe: 2%), secondary malignancies (2% to 6%; includes acute myelogenous leukemia and myelodysplastic syndrome)

Neuromuscular & skeletal: Back pain (8%), arthralgia (7%), myalgia (7%)

Respiratory: Cough (10%), throat irritation (10%), rhinitis (6%), bronchospasm (5%), epistaxis (3%), apnea (severe: 1%)

Miscellaneous: Diaphoresis (4%), HAMA antibody formation (4%), allergic reaction (2%), infusion reaction (severe: 1%), tumor pain (severe: 1%)

<1%: Anaphylactic reactions, arthritis, cerebral hemorrhage, cytogenetic abnormalities, encephalopathy, hematemesis, hemorrhage, hypersensitivity, meningioma (benign), pulmonary edema, pulmonary embolism, stroke (hemorrhagic), subdural hematoma, tachycardia, vaginal hemorrhage

Postmarketing and/or case reports: Cutaneous and mucocutaneous reactions (eg, erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis, bullous dermatitis and exfoliative dermatitis); infusion site erythema/ulceration (following extravasation), radiation injury/complications (delayed; in tissues in or near areas of lymphomatous involvement); radiation necrosis (following yttrium-90-ibritumomab extravasation)

Oncology: VesicantThere is an isolated case report of (delayed) erythema and ulceration, which is described as radiation necrosis following yttrium-90-ibritumomab extravasation (Williams, 2006).

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Anticoagulants: May enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid echinacea (may diminish therapeutic effect). Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have antiplatelet activity).

Monitoring ParametersPatients must be monitored for infusion-related allergic reactions (typically within 30-120 minutes of administration). Obtain CBC with differential and platelet counts weekly. Platelet count must be obtained prior to Day 7, 8,or 9. Monitor for up to 3 months after use.

Biodistribution of In-111 ibritumomab should be assessed by imaging at 48-72 hours post injection. Optional additional imaging may be performed to resolve ambiguities. If biodistribution is not acceptable, the patient should not proceed to Day 7, 8, or 9.

Monitoring: Lab TestsObtain CBC with differential and platelet counts weekly. Platelet count must be obtained prior to Day 7, 8, or 9. Monitor for up to 3 months after use.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Each kit contains 4 vials for preparation of either In-111 or Y-90 conjugate (as indicated on container label)

Injection, solution:

Zevalin®: 1.6 mg/mL (2 mL) [supplied with sodium acetate solution, formulation buffer vial (includes albumin 750 mg), and an empty reaction vial]

Generic AvailableNo

ManufacturerIDEC Pharmaceuticals

Mechanism of ActionIbritumomab is a monoclonal antibody directed against the CD20 antigen found on B lymphocytes (normal and malignant). Ibritumomab binding induces apoptosis in B lymphocytes *in vitro*. It is combined with the chelator tiuxetan, which acts as a specific chelation site for either Indium-111 (In-111) or Yttrium-90 (Y-90). The monoclonal antibody acts as a delivery system to direct the radioactive isotope to the targeted cells, however, binding has been observed in lymphoid cells throughout the body and in lymphoid nodules in organs such as the large and small intestines. Indium-111 is a gamma-emitter used to assess biodistribution of ibritumomab, while Y-90 emits beta particles. Beta-emission induces cellular damage through the formation of free radicals (in both target cells and surrounding cells).

Pharmacodynamics/Kinetics

Duration: Beta cell recovery begins in ~12 weeks; generally in normal range within 9 months

Distribution: To lymphoid cells throughout the body and in lymphoid nodules in organs such as the large and small intestines, spleen, testes, and liver

Metabolism: Has not been characterized; the product of yttrium-90 radioactive decay is zirconium-90 (nonradioactive); Indium-111 decays to cadmium-111 (nonradioactive)

Half-life elimination: Y-90 ibritumomab: 30 hours; Indium-111 decays with a physical half-life of 67 hours; Yttrium-90 decays with a physical half-life of 64 hours

Excretion: A median of 7.2% of the radiolabeled activity was excreted in urine over 7 days

Pharmacotherapy PearlsIbritumomab tiuxetan is produced in Chinese hamster ovary cell cultures. Kit is not radioactive. Radiolabeling of ibritumomab with Yttrium-90 and Indium-111 (not included in kit) must be performed by appropriate personnel in a specialized facility.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Hypotension, cough, throat irritation, rhinitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or anxiety

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; use caution with SSRIs, lithium, and valproic acid. Hematologic side effects are common; use caution with clozapine, carbamazepine, and valproic acid.

Index TermsIbritumomab Tiuxetan; IDEC-Y2B8; In-111 Ibritumomab; In-111 Zevalin; Y-90 Ibritumomab; Y-90 Zevalin

U.S. Brand NamesAdvil® Allergy Sinus; Advil® Multi-Symptom Cold

Canadian Brand NamesAdvil® Cold and Sinus Plus

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsTemporary relief of symptoms associated with the common cold, hay fever, or other respiratory allergies

Dosing: Adults**Common cold, hay fever, respiratory allergies:** Oral: One caplet every 4-6 hours while symptoms persist (maximum: 6 caplets/24 hours); treatment for >10 days is not recommended unless directed by healthcare provider

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Common cold, hay fever, respiratory allergies**: Oral: Children ≥12 years: Refer to adult dosing.

Administration: OralMay be administered with food or milk if stomach upset occurs.

Dietary ConsiderationsMay be taken with food or milk if stomach upset occurs.

StorageStore at 20°C to 25ºC (68°F to 77°F); avoid excessive heat.

ContraindicationsHypersensitivity to ibuprofen, pseudoephedrine, chlorpheniramine, or any component of the formulation; use with or within 2 weeks of an MAO inhibitor (MAO-I); immediately prior to or after coronary bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: NSAIDs are associated with an increased risk of adverse cardiovascular events, including MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Gastrointestinal events: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation. These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.
- Coronary artery bypass graft surgery: Use is contraindicated when used immediately prior to or after coronary artery bypass graft (CABG) surgery. Risk of MI and stroke may be increased with use following CABG surgery.
- Diabetes: Use with caution in patients with diabetes mellitus.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or urinary obstruction.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

- Thyroid disease: Use with caution in patients with thyroid disease.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Not for self-medication (OTC use) in children <12 years of age.

Other warnings/precautions:

- Self-medication (OTC use): Prior to self-medication, patients should contact healthcare provider if they have had recurring stomach pain or upset, ulcers, bleeding problems, asthma, emphysema, chronic bronchitis, high blood pressure, heart or kidney disease, thyroid disease, diabetes, glaucoma, enlarged prostate, other serious medical problems, are currently taking a diuretic, aspirin, anticoagulant, sedative or tranquilizer, or are ≥60 years of age. Recommended dosages should not be exceeded, due to an increased risk of GI bleeding. Stop use and consult a healthcare provider if symptoms get worse, newly appear, or continue; if an allergic reaction occurs; if nervousness, dizziness, or sleeplessness occurs; or if fever lasts for >3 days, congestion lasts for >7 days, or pain >10 days. Consuming ≥3 alcoholic beverages/day or taking longer than recommended may increase the risk of GI bleeding.

Pregnancy ConsiderationsSee individual agents.
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression and/or enhance gastric mucosal irritation).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Advil® Allergy Sinus, Advil® Multi-Symptom Cold: Ibuprofen 200 mg, pseudoephedrine hydrochloride 30 mg, and chlorpheniramine maleate 2 mg

Generic AvailableNo

Manufacturer

Wyeth

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Chlorpheniramine
- Ibuprofen
- Pseudoephedrine

Mental Health: Effects on Mental StatusMay cause dizziness, sedation, nervousness, or insomnia; may rarely cause confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor therapy. Ibuprofen component may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels. Concurrent use with psychotropic agents may produce worsening dry mouth.

Index TermsChlorpheniramine Maleate, Ibuprofen, and Pseudoephedrine; Ibuprofen, Pseudoephedrine, and Chlorpheniramine Maleate; Pseudoephedrine, Chlorpheniramine, and Ibuprofen

International Brand NamesAdvil Cold and Sinus Plus (CA)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Haltran® may be confused with Halfprin®

Pronunciation(eye byoo PROE fen)

U.S. Brand NamesAddaprin [OTC]; Advil® Children's [OTC]; Advil® Infants' [OTC]; Advil® Junior [OTC] [DSC]; Advil® Migraine [OTC]; Advil® [OTC]; Genpril® [OTC] [DSC]; I-Prin [OTC]; Ibu-200 [OTC]; Ibu®; Midol® Cramp and Body Aches [OTC]; Motrin® Children's [OTC]; Motrin® IB [OTC]; Motrin® Infants' [OTC]; Motrin® Junior [OTC]; Motrin® [DSC]; NeoProfen®; Proprinal [OTC]; Ultraprin [OTC]

Canadian Brand NamesAdvil®; Apo-Ibuprofen®; Motrin® (Children's); Motrin® IB; Novo-Profen; Nu-Ibuprofen

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral; Nonsteroidal Anti-inflammatory Drug (NSAID), Parenteral

Use: Labeled Indications

Oral: Inflammatory diseases and rheumatoid disorders including juvenile rheumatoid arthritis, mild-to-moderate pain, fever, dysmenorrhea

Injection: Ibuprofen lysine is for use in premature infants weighing between 500-1500 g and who are ≤32 weeks gestational age (GA) to induce closure of a clinically-significant patent ductus arteriosus (PDA) when usual treatments are ineffective

Use: Unlabeled/InvestigationalCystic fibrosis, gout, ankylosing spondylitis, acute migraine headache

Use: DentalManagement of pain and swelling

Dosing: Adults

Inflammatory disease: Oral: 400-800 mg/dose 3-4 times/day (maximum: 3.2 g/day)

Analgesia/pain/fever/dysmenorrhea: Oral: 200-400 mg/dose every 4-6 hours (maximum daily dose: 1.2 g, unless directed by physician; under physician supervision daily doses ≤2.4 g may be used)

OTC labeling (analgesic, antipyretic): Oral: 200 mg every 4-6 hours as needed (maximum: 1200 mg/24 hours); treatment for >10 days is not recommended unless directed by healthcare provider.

Migraine: 2 capsules at onset of symptoms (maximum: 400 mg/24 hours unless directed by healthcare provider)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Antipyretic: Oral: 6 months to 12 years: Temperature <102.5°F (39°C): 5 mg/kg/dose; temperature >102.5°F: 10 mg/kg/dose given every 6-8 hours; maximum daily dose: 40 mg/kg/day

Juvenile rheumatoid arthritis: Oral: 30-50 mg/kg/24 hours divided every 8 hours; start at lower end of dosing range and titrate upward (maximum: 2.4 g/day)

Analgesic: Oral: 4-10 mg/kg/dose every 6-8 hours

Cystic fibrosis (unlabeled use): Oral: Chronic (>4 years) twice daily dosing adjusted to maintain serum levels of 50-100 mcg/mL has been associated with slowing of disease progression in younger patients with mild lung disease

Patent ductus arteriosus: I.V.: Infants between 500-1500 g and ≤32 weeks GA: Initial dose: Ibuprofen 10 mg/kg, followed by two doses of 5 mg/kg at 24 and 48 hours. Dose should be based on birth weight.

OTC labeling (analgesic, antipyretic): Oral: **Note:** Treatment for >10 days is not recommended unless directed by healthcare provider.

Children 6 months to 11 years: See table; use of weight to select dose is preferred; doses may be repeated every 6-8 hours (maximum: 4 doses/day)

Children ≥12 years: Refer to adult dosing.

Ibuprofen Dosing

Weight (lb)	**Age**	**Dosage (mg)**
12-17	6-11 mo	50

18-23	12-23 mo	75
24-35	2-3 y	100
36-47	4-5 y	150
48-59	6-8 y	200
60-71	9-10 y	250
72-95	11 y	300

Dosing: Renal ImpairmentIf anuria or oliguria evident, hold dose until renal function returns to normal.

Dosing: Hepatic ImpairmentAvoid use in severe hepatic impairment.

Administration: I.V.For I.V. administration only; administration via umbilical arterial line has not been evaluated. Infuse over 15 minutes through port closest to insertion site. Avoid extravasation. Do not administer simultaneously via same line with TPN. If needed, interrupt TPN for 15 minutes prior to and after ibuprofen administration, keeping line open with dextrose or saline.

Administration: OralAdminister with food.

Dietary ConsiderationsShould be taken with food. Chewable tablets may contain phenylalanine; amount varies by product, consult manufacturers labeling.

Storage

Injection: Store at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light. Following dilution, administer within 30 minutes of preparation.

Suspension, tablet: Store at room temperature of 20°C to 25°C (68°F to 77°F).

ReconstitutionInjection: Dilute with dextrose or saline to an appropriate volume.

CompatibilityStable in dextrose, saline; **incompatible** with TPN solution.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to ibuprofen, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Ibuprofen lysine is contraindicated in preterm infants with untreated proven or suspected infection; congenital heart disease where patency of the PDA is necessary for pulmonary or systemic blood flow; bleeding (especially with active intracranial hemorrhage or GI bleed); thrombocytopenia; coagulation defects; proven or suspected necrotizing enterocolitis (NEC); significant renal dysfunction

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and**

perforation. These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

Dosage form specific issues:

- Injection: Hold second or third doses if urinary output is <0.6 mL/kg/hour. May alter signs of infection. May inhibit platelet aggregation; monitor for signs of bleeding. May displace bilirubin; use caution when total bilirubin is elevated. Long-term evaluations of neurodevelopment, growth, or diseases associated with prematurity following treatment have not been conducted. A second course of treatment, alternative pharmacologic therapy or surgery may be needed if the ductus arteriosus fails to close or reopens following the initial course of therapy. Avoid extravasation.

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Self medication (OTC use): Prior to self-medication, patients should contact healthcare provider if they have had recurring stomach pain or upset, ulcers, bleeding problems, high blood pressure, heart or kidney disease, other serious medical problems, are currently taking a diuretic, aspirin, anticoagulant, or are ≥60 years of age. If patients are using for migraines, they should also contact healthcare provider if they have not had a migraine diagnosis by healthcare provider, a headache that is different from usual migraine, worst headache of life, fever and neck stiffness, headache from head injury or coughing, first headache at ≥50 years of age, daily headache, or migraine requiring bed rest. Recommended dosages should not be exceeded, due to an increased risk of GI bleeding. Stop use and consult a healthcare provider if symptoms get worse, newly appear, fever lasts for >3 days or pain lasts >3 days (children) and >10 days (adults). Do not give for >10 days unless instructed by healthcare provider. Consuming ≥3 alcoholic beverages/day or taking longer than recommended may increase the risk of GI bleeding.

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but the elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsLimited data suggests minimal excretion in breast milk.

Adverse Reactions

Oral:

1% to 10%:

Cardiovascular: Edema (1% to 3%)

Central nervous system: Dizziness (3% to 9%), headache (1% to 3%), nervousness (1% to 3%)

Dermatologic: Rash (3% to 9%), itching (1% to 3%)

Endocrine & metabolic: Fluid retention (1% to 3%)

Gastrointestinal: Epigastric pain (3% to 9%), heartburn (3% to 9%), nausea (3% to 9%), abdominal pain/cramps/distress (1% to 3%), appetite decreased (1% to 3%), constipation (1% to 3%), diarrhea (1% to 3%), dyspepsia (1% to 3%), flatulence (1% to 3%), vomiting (1% to 3%)

Otic: Tinnitus (3% to 9%)

<1%: Acute renal failure, agranulocytosis, allergic rhinitis, alopecia, amblyopia, anaphylaxis, arrhythmia, aplastic anemia, aseptic meningitis, azotemia, blurred vision, bone marrow suppression, bronchospasm, CHF, confusion, conjunctivitis, creatinine clearance decreased, cystitis, depression, drowsiness, dry eyes, duodenal ulcer, edema, emotional lability, eosinophilia, epistaxis, erythema multiforme, gastric ulcer, gastritis, GI bleed, GI hemorrhage, GI ulceration, hallucinations, hearing decreased, hematuria, hematocrit decreased, hemoglobin decreased, hemolytic anemia, hepatitis, hypertension, inhibition of platelet aggregation, insomnia, jaundice, liver function tests abnormal, leukopenia, melena, neutropenia, palpitation, pancreatitis, peripheral neuropathy, photosensitivity, polydipsia, polyuria, Stevens-Johnson syndrome, tachycardia, thrombocytopenia, toxic amblyopia, toxic epidermal necrolysis, urticaria, vesiculobullous eruptions, vision changes

Injection:

>10%:

Cardiovascular: Intraventricular hemorrhage (29%; grade 3/4: 15%)

Dermatologic: Skin irritation (16%)

Endocrine & metabolic: Hypocalcemia (12%), hypoglycemia (12%)

Gastrointestinal: GI disorders, non NEC (22%)

Hematologic: Anemia (32%)

Respiratory: Apnea (28%), respiratory infection (19%)

Miscellaneous: Sepsis (43%)

1% to 10%:

Cardiovascular: Edema (4%)

Endocrine & metabolic: Adrenal insufficiency (7%), hypernatremia (7%)

Genitourinary: Urinary tract infection (9%)

Renal: Urea increased (7%), renal impairment (6%), creatinine increased (3%), urine output decreased (3%; small decrease reported on days 2-6 with compensatory increase in output on day 9), renal failure (1%)

Respiratory: Respiratory failure (10%), atelectasis (4%)

Frequency not defined: Abdominal distension, cholestasis, feeding problems, gastritis, GI reflux, heart failure, hyperglycemia, hypotension, ileus, infection, inguinal hernia, injection site reaction, jaundice, neutropenia, seizure, tachycardia, thrombocytopenia

Postmarketing and/or case reports: GI perforation, necrotizing enterocolitis

Metabolism/Transport Effects **Substrate** (minor) of CYP2C9, 2C19; **Inhibits** CYP2C9 (strong)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Ibuprofen peak serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersCBC; occult blood loss and periodic liver function tests; monitor response (pain, range of motion, grip strength, mobility, ADL function), inflammation; observe for weight gain, edema; monitor renal function (urine output, serum BUN and creatinine); observe for bleeding, bruising; evaluate gastrointestinal effects (abdominal pain, bleeding, dyspepsia); mental confusion, disorientation; with long-term therapy, periodic ophthalmic exams

Injection: Renal function, signs of infection or bleeding, ECG

Reference RangePlasma concentrations >200 mcg/mL may be associated with severe toxicity

PDA: Minimum effective level: 10-12 mg/L

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess patient for allergic reaction to salicylates or other NSAIDs. Assess other medications patient may be taking for additive or adverse interactions. Monitor blood pressure at the beginning of therapy and periodically during use. Monitor therapeutic effectiveness and signs of adverse reactions or overdose at beginning of therapy and periodically during long-term therapy. With long-term therapy, periodic ophthalmic exams are recommended. Assess knowledge/teach patient appropriate use. Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Monitoring: Lab TestsCBC, periodic liver function, renal function (serum BUN and creatinine)

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Adverse reactions can occur with overuse. Consult your prescriber before use if you have hypertension or heart failure. Do not take longer than 3 days for fever, or 10 days for pain without consulting medical advisor. Take with food or milk. While using this medication, do not use alcohol, excessive amounts of vitamin C, or salicylate-containing foods (curry powder, prunes, raisins, tea, or licorice), other prescription or OTC medications containing aspirin or salicylate, or other NSAIDs without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea, vomiting, gastric discomfort (frequent mouth care, small frequent meals, chewing gum, sucking lozenges may help). GI bleeding, ulceration, or perforation can occur with or without pain. Stop taking medication and report ringing in ears; persistent cramping or stomach pain; unresolved nausea or vomiting; respiratory difficulty or shortness of breath; unusual bruising or bleeding (mouth, urine, stool); skin rash; unusual swelling of extremities; chest pain; or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet: 200 mg [OTC]

Advil®: 200 mg [contains sodium benzoate]

Ibu-200, Motrin® IB: 200 mg

Motrin® Junior: 100 mg [scored]

Capsule, liquid-filled:

Advil®: 200 mg [solubilized ibuprofen; contains potassium 20 mg]

Advil® Migraine: 200 mg [solubilized ibuprofen; contains potassium 20 mg]

Gelcap:

Advil®: 200 mg [contains coconut oil]

Injection, solution, as lysine [preservative free]:

NeoProfen®: 17.1 mg/mL (2 mL) [equivalent to ibuprofen 10 mg/mL]

Suspension, oral: 100 mg/5 mL (5 mL, 10 mL, 120 mL, 240 mL, 480 mL)

Advil® Children's: 100 mg/5 mL (120 mL) [contains sodium benzoate, sodium, propylene glycol; blue raspberry, fruit, and grape flavors]

Motrin® Children's: 100 mg/5 mL (60 mL, 120 mL) [contains sodium benzoate; berry, dye free berry, bubble gum, and grape flavors]

Suspension, oral [concentrate, drops]: 40 mg/mL (15 mL)

Advil® Infants': 40 mg/mL (15 mL) [contains sodium benzoate; fruit, grape, and white grape flavors]

Motrin® Infants': 40 mg/mL (15 mL) [contains sodium benzoate; ethanol free; berry and dye-free berry flavors]

Tablet: 200 mg [OTC], 400 mg, 600 mg, 800 mg

Addaprin: 200 mg

Advil®: 200 mg [contains sodium benzoate]

Advil® Junior: 100 mg [contains sodium benzoate; coated tablets] [DSC]

Genpril® [DSC], I-Prin, Midol® Cramp and Body Aches, Motrin® IB, Proprinal, Ultraprin: 200 mg

Ibu®: 400 mg, 600 mg, 800 mg

Ibu-200: 200 mg

Motrin®: 400 mg, 600 mg, 800 mg [DSC]

Proprinal: 200 mg [contains sodium benzoate]

Ultraprin: 200 mg [sugar free]

Tablet, chewable:

Advil® Children's: 50 mg [contains phenylalanine 2.1 mg; grape flavors]

Advil® Junior: 100 mg [contains phenylalanine 4.2 mg; grape flavors] [DSC]

Motrin® Junior: 100 mg [contains phenylalanine 2.1 mg; grape and orange flavors]

Generic AvailableYes: Caplet, suspension, tablet

Pricing: U.S. (www.drugstore.com)

Suspension (Ibuprofen)

100 mg/5 mL (473): $24.27

Tablets (Advil)

200 mg (100): $18.99

Tablets (Ibuprofen)

400 mg (30): $11.99

600 mg (90): $14.99

Tablets (Motrin)

600 mg (30): $17.99

Mechanism of Action Reversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: 30-60 minutes; Anti-inflammatory: ≤7 days

Peak effect: 1-2 weeks

Duration: 4-6 hours

Absorption: Oral: Rapid (85%)

Distribution: Premature infants with ductal closure (highly variable between studies):

Day 3: 145-349 mL/kg

Day 5: 72-222 mL/kg

Protein binding: 90% to 99%

Metabolism: Hepatic via oxidation

Half-life elimination:

Premature infants (highly variable between studies):

Day 3: 35-51 hours

Day 5: 20-33 hours

Children 3 months to 10 years: 1.6 ± 0.7 hours

Adults: 2-4 hours; End-stage renal disease: Unchanged

Time to peak: ~1-2 hours

Excretion: Urine (80% as metabolites; 1% as unchanged drug); some feces

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health Professional Considerations Preoperative use of ibuprofen at a dose of 400-600 mg every 6 hours 24 hours before the appointment decreases postoperative edema and hastens healing time.

New information from the FDA states that ibuprofen can interfere with the antiplatelet effect of low-dose aspirin (81 mg/day), potentially rendering aspirin less effective when used for cardioprotection and stroke protection. In situations where these drugs could be used concomitantly, the FDA has provided the following information.

Patients who use immediate release aspirin (not enteric-coated aspirin) and take a single dose or chronic doses of ibuprofen 400 mg, should dose the ibuprofen at least **30 minutes or longer after aspirin ingestion or more than 8 hours before aspirin ingestion** to avoid attenuation of aspirin's effect.

At this time, recommendations about the timing of ibuprofen 400 mg in patients taking enteric-coated low-dose aspirin cannot be made based on available data. One study however, showed that the antiplatelet effect of enteric-coated low-dose aspirin was attenuated when ibuprofen 400 mg was dosed 2, 7, and 12 hours after aspirin (Catella-Lawson, 2001).

With occasional use of ibuprofen, there is likely to be minimal risk from any attenuation of the antiplatelet effect of low-dose aspirin, because of a long-lasting effect of aspirin on platelets.

Other over-the-counter (OTC) NSAIDs (ie, naproxen sodium and ketoprofen) should be viewed as having the potential to interfere with the antiplatelet effect of low-dose aspirin until proven otherwise. However, the FDA is unaware of any studies that have looked at the same type of interference by ketoprofen with low-dose aspirin. One study of naproxen and low-dose aspirin has suggested that naproxen may interfere with aspirin's antiplatelet activity when they are coadministered (Steinhubl, 2005). However, naproxen 500 mg administered 2 hours before or after aspirin 100 mg, did not interfere with aspirin's antiplatelet effect. The FDA stated that there is no data looking at doses of naproxen <500 mg. Naproxen OTC strength is 220 mg tablets.

Dental Health: Effects on Dental Treatment In a statement released on September 8, 2006, the FDA notified consumers and healthcare professionals that the administration of ibuprofen for pain relief to patients taking aspirin for cardioprotection may interfere with aspirin's cardiovascular benefits. The FDA states that ibuprofen can interfere with the antiplatelet effect of low-dose aspirin (81 mg/day). This could result in diminished effectiveness of aspirin as used for cardioprotection and stroke prevention. The FDA adds that although ibuprofen and aspirin can be taken together, it is recommended that consumers talk with their healthcare providers for additional information. For more information, including how to advise aspirin patients requiring ibuprofen for pain relief, see Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause nervousness; may rarely cause insomnia, confusion, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take 1/2 -2 hours after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. May precipitate renal failure in dehydrated patients.

Index Terms*p*-Isobutylhydratropic Acid; Ibuprofen Lysine

Ibutilide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(i BYOO ti lide)

U.S. Brand NamesCorvert®

Pharmacologic CategoryAntiarrhythmic Agent, Class III

Use: Labeled IndicationsAcute termination of atrial fibrillation or flutter of recent onset; the effectiveness of ibutilide has not been determined in patients with arrhythmias >90 days in duration

Dosing: Adults

Atrial fibrillation/flutter: I.V.:

<60 kg: 0.01 mg/kg over 10 minutes

≥60 kg: 1 mg over 10 minutes

If the arrhythmia does not terminate within 10 minutes after the end of the initial infusion, a second infusion of equal strength may be infused over a 10-minute period.

Dosing: ElderlyRefer to adult dosing. Dose selection should be cautious, usually starting at the lower end of the dosing range.

Administration: I.V.May be administered undiluted or diluted in 50 mL diluent (0.9% NS or D_5W). Infuse over 10 minutes.

Administration: I.V. DetailObserve patient with continuous ECG monitoring for at least 4 hours following infusion or until QT_c has returned to baseline. Skilled personnel and proper equipment should be available during administration of ibutilide and subsequent monitoring of the patient.

StorageAdmixtures are chemically and physically stable for 24 hours at room temperature and for 48 hours at refrigerated temperatures.

ReconstitutionMay be administered undiluted or diluted in 50 mL diluent (0.9% NS or D_5W).

ContraindicationsHypersensitivity to ibutilide or any component of the formulation; QT_c >440 msec

Allergy Considerations

- Ibutilide Allergy

Warnings/Precautions

Boxed warnings:

- Chronic atrial fibrillation: See “Disease-related concerns” below.
- Proarrhythmic effects: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Conduction disturbances: Monitor for heart block.
- Proarrhythmic effects: **[U.S. Boxed Warning]: Potentially fatal arrhythmias (eg, polymorphic ventricular tachycardia) can occur with ibutilide, usually in association with torsade de pointes (QT prolongation).** Studies indicate a 1.7% incidence of arrhythmias in treated patients.

Disease-related concerns:

- Arrhythmias: Appropriate use: The drug should be given in a setting of continuous ECG monitoring and by personnel trained in treating arrhythmias particularly polymorphic ventricular tachycardia.
- Chronic atrial fibrillation: **[U.S. Boxed Warning]: Patients with chronic atrial fibrillation may not be the best candidates for ibutilide since they often revert after conversion and the risks of treatment may not be justified when compared to alternative management.**
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Hepatic impairment: Dosing adjustments are not required in patients with hepatic impairment.
- Renal impairment: Dosing adjustments are not required in patients with renal impairment.

Concurrent drug therapy issues:

- Drugs with QT prolongation potential: Avoid concurrent use with any drug that can prolong QT interval.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic and embryocidal in rats; avoid use in pregnancy
LactationEnters breast milk/contraindicated
Adverse Reactions

1% to 10%:

Cardiovascular: Ventricular extrasystoles (5.1%), nonsustained monomorphic ventricular tachycardia (4.9%), nonsustained polymorphic ventricular tachycardia (2.7%), tachycardia/supraventricular tachycardia (2.7%), hypotension (2%), bundle branch block (1.9%), sustained polymorphic ventricular tachycardia (eg, torsade de pointes) (1.7%, often requiring cardioversion), AV block (1.5%), bradycardia (1.2%), QT segment prolongation, hypertension (1.2%), palpitation (1%)

Central nervous system: Headache (3.6%)

Gastrointestinal: Nausea (>1%)

<1% (Limited to important or life-threatening): Supraventricular extrasystoles (0.9%), nodal arrhythmia (0.7%), CHF (0.5%), syncope (0.3%, not > placebo), idioventricular rhythm (0.2%), sustained monomorphic ventricular tachycardia (0.2%), renal failure (0.3%)

Postmarketing and/or case reports: Erythematous bullous lesions

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersObserve patient with continuous ECG monitoring for at least 4 hours following infusion or until QT_c has returned to baseline; skilled personnel and proper equipment should be available during administration of ibutilide and subsequent monitoring of the patient
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Requires infusion pump and continuous cardiac and hemodynamic monitoring during and for 4 hours following infusion. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions. Teach patient adverse symptoms to report.
Monitoring: Lab TestsElectrolytes
Patient EducationThis drug is only given I.V. and you will be on continuous cardiac monitoring during and for several hours following administration. You may experience headache or irregular heartbeat during infusion. Report chest pain or respiratory difficulty immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as fumarate: 0.1 mg/mL (10 mL)

Generic AvailableNo
ManufacturerPharmacia & Upjohn
Mechanism of ActionExact mechanism of action is unknown; prolongs the action potential in cardiac tissue
Pharmacodynamics/Kinetics

Onset of action: ~90 minutes after start of infusion ($^1/_2$ of conversions to sinus rhythm occur during infusion)

Distribution: V_d: 11 L/kg

Protein binding: 40%

Metabolism: Extensively hepatic; oxidation

Half-life elimination: 2-12 hours (average: 6 hours)

Excretion: Urine (82%, 7% as unchanged drug and metabolites); feces (19%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsIbutilide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConcurrent use with phenothiazine and antidepressants may produce prolongation of the QT interval; use combination with caution; consider a nonphenothiazine antipsychotic

Cardiovascular ConsiderationsIbutilide may be used for pharmacologic cardioversion of atrial fibrillation or flutter. Ibutilide may lower the energy requirement for DC cardioversion in atrial fibrillation. However, a significant problem associated with therapy is torsade de pointes. It is important that the administration of ibutilide be carried out under closely monitored conditions and that facilities for cardiopulmonary resuscitation be at the bedside. It is also important that all precautionary measures for standard electrical cardioversion (eg, electrolytes, thromboembolic precautions) be maintained.

Anesthesia and Critical Care Concerns/Other ConsiderationsIbutilide may lower the energy requirement for direct current cardioversion in atrial fibrillation; effective for termination of postsurgical atrial fibrillation or atrial flutter, but at the risk of precipitating ventricular arrhythmias.

Index TermsIbutilide Fumarate

Medication Safety Issues

Special care is warranted in patients with diabetes: Due to potential interference by maltose, careful attention must be given to glucose monitoring; only glucose monitors and test strips which employ the glucose-specific method should be used. Innacurate methods (GDH-PQ or glucose-dye-oxidoreductase methods) can result in falsely-elevated readings. Inaccurate readings may mask recognition of true hypoglycemia, or may prompt the administration of insulin, potentially leading to life-threatening consequences.

Pronunciation(eye KOE dex trin)

U.S. Brand NamesAdept®; Extraneal®

Pharmacologic CategoryAdhesiolytic; Peritoneal Dialysate, Osmotic

Use: Labeled Indications

Adept®: Reduction of postsurgical adhesions in gynecologic laparoscopic procedures

Extraneal®: Daily exchange for the long dwell (8- to 16-hour) during continuous ambulatory peritoneal dialysis (CAPD) or automated peritoneal dialysis (APD) for the management of end-stage renal disease (ESRD); improvement of long-dwell ultrafiltration and clearance of creatinine and urea nitrogen (compared to 4.25% dextrose) in patients with high/average or greater transport characteristics as measured by peritoneal equilibration test (PET)

Dosing: Adults

CAPD or APD (Extraneal®): Intraperitoneal: Given as a single daily exchange in CAPD or APD; dwell time of 8-16 hours is suggested

Laparoscopic gynecologic surgery (Adept®): Intraperitoneal: Irrigate with at least 100 mL every 30 minutes during surgery; aspirate remaining fluid after surgery is completed, then instill 1 L into the cavity

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.Not for I.V. injection.

Administration: OtherIntraperitoneal administration only; not for I.V. injection.

Adept®: Warm to body temperature prior to use

Osmolarity: 278 mOsm/L

Extraneal®: If using manual method, infuse into intraperitoneal cavity over 10-20 minutes. For increased comfort, dry heat (such as that derived from a heating pad) may be used to warm the solution in the over pouch to 37°C (98.6°F) prior to administration. Neither warm water nor the microwave should be used for warming.

Osmolarity: 282-286 mOsm/L

pH: 5.0-6.0.

Dietary ConsiderationsCAPD or APD: Monitor fluid intake; avoid over-/under hydration

Storage

Adept®: Store between 4°C and 30°C (39°F to 86°F); do not refrigerate or freeze. May be stored for up to 14 days in a warming device, as long as it is not removed and replaced back into the device.

Extraneal®: Store at controlled room temperature of 15°C to 30°C (68°F to 86°F) in moisture barrier overwrap in carton; do not freeze. Potassium chloride may be added up to a concentration of 4 mEq/L.

Compatibility**Compatible when admixed:** Extraneal®: Potassium chloride. Potassium chloride may be added up to a concentration of 4 mEq/L.

ContraindicationsHypersensitivity to icodextrin, cornstarch, or any component of the formulation; patients with glycogen storage disease

Adept® is also contraindicated with infection of the abdominopelvic cavity; procedures with laparotomy incision; bowel resection or repair; appendectomy; maltose or isomaltose intolerance

Warnings/Precautions

Dosage form specific issues:

- Adept®: Safety and efficacy have not been established for use in pregnancy, volumes left in peritoneal cavity >1 L, hepatic or renal dysfunction, or with a breach in the vaginal epithelium. Effectiveness has not been established for long-term clinical outcomes following surgery (eg, pregnancy, pain). Serious postoperative complications (dehiscence, cutaneous fistula formation) have been associated with laparotomy incision; anastomotic failure, ileus and peritonitis have been reported following bowel resection or repair, or appendectomy; use is contraindicated with these procedures. Postoperative leaking may occur through laparoscopic port site and may be associated with wound complications; meticulous closure of the fascia may help reduce complications. Use may be associated with vulvar swelling, most cases resolving within 1 week.

- Extraneal®: Use with caution with a history of abdominal surgery (within 30 days), abdominal fistulae, tumors, open wounds, hernia or other conditions which compromise the integrity of the abdominal wall, abdominal surface, or intra-abdominal cavity. Caution should be used in patients who are malnourished, have decreased respiratory function, decreased potassium, or increased calcium levels.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Glucose monitoring: Due to potential interference by maltose, careful attention must be given to glucose monitoring; only glucose monitors and test strips which employ the glucose-specific method should be used. Inaccurate methods (GDH-PQ or glucose-dye-oxidoreductase methods) can result in falsely-elevated readings. Inaccurate readings may mask recognition of true hypoglycemia, or may prompt the administration of insulin, potentially leading to life-threatening consequences.

- I.V. administration: Do not administer intravenously.

Pregnancy Risk FactorC

Pregnancy ConsiderationsComplete reproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

CAPD or APD (Extraneal®):

>10%:

Cardiovascular: Hypertension (13%)

Respiratory: Upper respiratory infection (15%)

Miscellaneous: Peritonitis (26% vs 25% in controls)

5% to 10%:

Cardiovascular: Edema (up to 6%), chest pain (5%), hypervolemia, hypotension

Central nervous system: Headache (9%), dizziness

Dermatological: Rash (10%), pruritus, skin disorder

Endocrine & metabolic: Hyperglycemia (5%), hyperphosphatemia, hypokalemia, hypoproteinemia

Gastrointestinal: Abdominal pain (8%), nausea (7%), dyspepsia (5%), diarrhea, vomiting

Hematologic: Anemia

Neuromuscular & skeletal: Arthralgia, pain, weakness

Respiratory: Cough increased (7%), dyspnea

Miscellaneous: Accidental injury (6%), flu syndrome (7%), infection

<5%:

Cardiovascular: Postural hypotension, CHF

Central nervous system: Confusion

Dermatologic: Exfoliative dermatitis, erythema multiforme, eczema, maculopapular rash, vesicobullous rash

Endocrine & metabolic: Hypercalcemia, hypochloremia, hypoglycemia, hyponatremia, alkaline phosphatase increased

Gastrointestinal: Abdominal enlargement, cramps

Hepatic: ALT increased, AST increased

Local: Infusion pain

Miscellaneous: Cloudy effluent

Laparoscopic surgery (Adept®):

>10%:

Central nervous system: Headache (35%)

Endocrine & metabolic: Dysmenorrhea (13%)

Gastrointestinal: Nausea (6% to 17%), constipation (11%)

1% to 10%:

Central nervous system: Pyrexia (6%), insomnia (5%)

Gastrointestinal: Flatulence (8%), abdominal pain (7%), abdominal distention (6%), vomiting (6%), diarrhea (1%)

Genitourinary: Dysuria (7%), urinary tract infection (7%); labial, vulvar, or vaginal swelling (6%); vaginal bleeding (6%)

Neuromuscular & skeletal: Arthralgia (9%), back pain (8%)

Respiratory: Nasopharyngitis (7%), cough (4%)

Postmarketing and/or case reports: Sterile peritonitis

Drug InteractionsThere are no known significant interactions.

Test InteractionsFalsely-elevated blood glucose levels may occur when glucose monitoring devices and test strips utilizing the glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ or glucose-dye-oxidoreductase) based methods are used. Glucose monitoring devices and test strips which utilize the glucose-specific methodologies are recommended.

Inaccurate serum amylase levels may be reported. Icodextrin and the metabolites may interfere with enzymatic-based amylase assays.

Monitoring ParametersCAPD or APD: Serum electrolytes (chloride and sodium may be decreased); fluid balance

Nursing: Physical Assessment/MonitoringSee specific Administration instructions (intraperitoneal administration only, not for I.V. infusion). Assess results of laboratory reports, blood pressure, nutritional status, and hydration status on regular basis. **Note:** When used for patients with diabetes, glucose levels should be monitored closely using only glucose-specific methods (see Lab Interactions) to reduce potential for inaccurate readings. Teach possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCAPD or APD: Serum electrolytes

Patient EducationYou will be monitored closely during peritoneal dialyses. Report immediately any burning or pain; dizziness or acute headache; swelling of extremities; gastrointestinal upset (nausea, vomiting, or diarrhea); swelling of abdomen or abdominal pain; flu symptoms or signs of respiratory infection (cough or difficulty breathing); unusual weakness or fatigue; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intraperitoneal:

Adept®: 4% (1.5 L) [for laparoscopic surgery; contains sodium chloride 5.4 g/L, sodium lactate 4.5 g/L, calcium chloride 257 mg/L, magnesium chloride 51 mg/L]

Extraneal: 7.5% (1.5 L, 2 L, 2.5 L) [for peritoneal dialysis; contains sodium 132 mEq/L, calcium 3.5 mEq/L, magnesium 0.5 mEq/L, chloride 96 mEq/L, and lactate 40 mEq/L]

Generic AvailableNo

Mechanism of ActionWhen used for dialysis, icodextrin exerts osmotic pressure across small intercellular pores resulting in transcapillary ultrafiltration throughout the dwell while providing electrolytes and lactate for the maintenance of both the electrolyte and acid-base balance. When used for laparoscopic surgery, the colloidal osmotic action allows the fluid to be retained in the peritoneal cavity for 3-4 days, physically providing a temporary separation of peritoneal surfaces and minimizing adhesion formation.

Pharmacodynamics/Kinetics

Absorption: 40% during 12-hour dwell (CAPD); slowly transferred into systemic circulation via peritoneal lymphatic drainage

Metabolism: Primarily by alpha-amylase into maltose (DP2), maltotriose (DP3), maltotetraose (DP4), and other glucose polymers with a lower degree of polymerization

Time to peak, plasma: 13 hours

Excretion: Renal (amount proportional to residual renal function); diasylate

Pharmacotherapy PearlsFor a list of glucose monitor and test strip manufacturers for verification, the Baxter Renal Clinical Help Line at 1-888-Renal-Help may be called.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

IDArubicin may be confused with DOXOrubicin, DAUNOrubicin, epirubicin

Idamycin PFS® may be confused with Adriamycin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye da ROO bi sin)

U.S. Brand NamesIdamycin PFS®

Canadian Brand NamesIdamycin®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline; Antineoplastic Agent, Antibiotic

Use: Labeled IndicationsTreatment of acute leukemias (AML, ANLL, ALL), accelerated phase or blast crisis of chronic myelogenous leukemia (CML), breast cancer

Use: Unlabeled/InvestigationalAutologous hematopoietic stem cell transplantation

Dosing: AdultsRefer to individual protocols.

Leukemia: I.V.:

Induction: 12 mg/m^2/day for 3 days

Consolidation: 10-12 mg/m^2/day for 2 days

Stem cell transplantation (unlabeled use): 20 mg/m^2/24 hours continuous I.V. infusion **or** 21 mg/m^2/24 hours continuous infusion for 48 hours (both with high-dose oral busulfan)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Leukemia: I.V.: 10-12 mg/m^2 once daily for 3 days every 3 weeks.

Solid tumors: I.V.: 5 mg/m^2 once daily for 3 days every 3 weeks.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain specific dosing adjustment guidelines; however, it does reccomend that dosage reductions be made. Patients with S_{cr}: ≥2 mg/dL did not receive treatment in many clinical trials. The following guidelines have been used by some clinicians (Aronoff, 2007):

Children:

Cl_{cr} <50 mL/minute: Administer 75% of dose.

Hemodialysis: Administer 75% of dose.

Continuous ambulatory peritoneal dialysis (CAPD): Administer 75% of dose.

Continuous renal replacement therapy (CRRT): Administer 75% of dose.

Adults:

Cl_{cr} 10-50 mL/minute: Administer 75% of dose.

Cl_{cr} <10 mL/minute: Administer 50% of dose.

Hemodialysis: Supplemental dose not needed.

Continuous ambulatory peritoneal dialysis (CAPD): Supplemental dose not needed.

Dosing: Hepatic Impairment

Bilirubin 2.6-5 mg/dL: Administer 50% of dose

Bilirubin >5 mg/dL: Avoid use

Dosing: Combination Regimens

Leukemia, acute myeloid:

7 + 3 (Idarubicin)

Idarubicin, Cytarabine, Etoposide (ICE Protocol)

Idarubicin, Cytarabine, Etoposide (IDA-Based BF12)

FLAG-IDA

Leukemia, acute promyelocytic: Tretinoin-Idarubicin

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Do not administer I.M. or SubQ; administer as slow push over 3-5 minutes, preferably into the side of a freely-running saline or dextrose infusion **or** as intermittent infusion over 10-15 minutes into a free-flowing I.V. solution of NS or D_5W; also occasionally administered as a bladder lavage.

Administration: I.V. DetailAdminister into a free-flowing I.V. solution of NS or D_5W. Avoid extravasation - potent vesicant. Local erythematous streaking along the vein may indicate rapid administration. Unless specific data is available, do not mix with other drugs.

Extravasation management: Topical cooling may be achieved using ice packs or cooling pad with circulating ice water. Cooling of site for 24 hours as tolerated by the patient. Elevate and rest extremity 24-48 hours, then resume normal activity as tolerated. Application of cold inhibits vesicant's cytotoxicity. **Application of heat can be harmful and is contraindicated.** If pain, erythema, and/or swelling persist beyond 48 hours, refer patient immediately to plastic surgeon for consultation and possible debridement.

pH: 5-7

StorageStore intact vials of solution under refrigeration (2°C to 8°C/36°F to 46°F). Protect from light. Solutions diluted in D_5W or NS for infusion are stable for 4 weeks at room temperature, protected from light. Syringe and IVPB solutions are stable for 72 hours at room temperature and 7 days under refrigeration.

CompatibilityStable in D_5NS, D_5W, LR, NS, sterile water for injection, **incompatible** with bacteriostatic water.

Y-site administration: Compatible: Amifostine, amikacin, aztreonam, cimetidine, cladribine, cyclophosphamide, cytarabine, diphenhydramine, droperidol, erythromycin lactobionate, etoposide phosphate, filgrastim, gemcitabine, granisetron, imipenem/cilastatin, magnesium sulfate, mannitol, melphalan, metoclopramide, potassium chloride, ranitidine, sargramostim, thiotepa, vinorelbine. **Incompatible:** Acyclovir, allopurinol, ampicillin/sulbactam, cefazolin, cefepime, ceftazidime, clindamycin, dexamethasone sodium phosphate, etoposide, fluorouracil, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, lorazepam, meperidine, methotrexate, piperacillin/tazobactam, sodium bicarbonate, teniposide, vancomycin, vincristine.

Compatibility when admixed: Incompatible: Heparin.

ContraindicationsHypersensitivity to idarubicin, other anthracyclines, or any component of the formulation; bilirubin >5 mg/dL; pregnancy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hepatic impairment: See “Disease-related concerns” below.
- Myocardial toxicity: See “Concerns related to adverse effects” below.
- Renal impairment: See “Disease-related concerns” below.
- Skin irritation/extravasation: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause severe myelosuppression.**
- Hyperuricemia: Rapid lysis of leukemic cells may lead to hyperuricemia.
- Myocardial toxicity: **[U.S. Boxed Warning]: May cause myocardial toxicity (HF, arrhythmias or cardiomyopathies) and is more common in patients who have previously received anthracyclines or have pre-existing cardiac disease.** The risk of myocardial toxicity is also increased in patients with concomitant or prior mediastinal/pericardial irradiation, patients with anemia, bone marrow depression, infections, leukemic pericarditis or myocarditis. Monitor cardiac function during treatment.

- Skin irritation/extravasation: **[U.S. Boxed Warning] For I.V. administration only; may cause severe local tissue damage and necrosis if extravasation occurs.**

Disease-related concerns:

- Bone marrow suppression: Use with extreme caution in patients with pre-existing bone marrow suppression from prior treatment or radiation; use only if benefits warrants risks.

- Cardiovascular disease: Use with caution in patients with pre-existing cardiac disease; may increase risk of cardiotoxicity.

- Hepatic impairment: **[U.S. Boxed Warning] Use with caution in patients with hepatic impairment; may require dosage reductions.**

- Infections: Systemic infections should be managed prior to initiation of treatment.

- Renal impairment: **[U.S. Boxed Warning] Use with caution in patients with renal impairment; may require dosage reductions.**

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Geriatric ConsiderationsDuring induction therapy, patients >60 years of age experience CHF, arrhythmias, MI, and decline in LVEF more frequently than younger populations.
Pregnancy Risk FactorD
LactationExcretion in breast milk unknown
Adverse Reactions

>10%:

Cardiovascular: Transient ECG abnormalities (supraventricular tachycardia, S-T wave changes, atrial or ventricular extrasystoles); generally asymptomatic and self-limiting. CHF, dose related. The relative cardiotoxicity of idarubicin compared to doxorubicin is unclear. Some investigators report no increase in cardiac toxicity at cumulative oral idarubicin doses up to 540 mg/m^2; other reports suggest a maximum cumulative intravenous dose of 150 mg/m^2.

Central nervous system: Headache

Dermatologic: Alopecia (25% to 30%), radiation recall, skin rash (11%), urticaria

Gastrointestinal: Nausea, vomiting (30% to 60%); diarrhea (9% to 22%); stomatitis (11%); GI hemorrhage (30%)

Genitourinary: Discoloration of urine (darker yellow)

Hematologic: Myelosuppression, primarily leukopenia; thrombocytopenia and anemia. Effects are generally less severe with oral dosing.

Nadir: 10-15 days

Recovery: 21-28 days

Hepatic: Bilirubin and transaminases increased (44%)

1% to 10%:

Central nervous system: Seizure

Neuromuscular & skeletal: Peripheral neuropathy

<1%: Hyperuricemia

Oncology: VesicantYes; see Management of Drug Extravasations.
Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential, platelet count, cardiac function, serum electrolytes, creatinine, uric acid, ALT, AST, bilirubin, signs of extravasation

Nursing: Physical Assessment/MonitoringSee Administration for specific infusion directions. Infusion site must be closely monitored; extravasation can cause severe cellulitis or tissue necrosis (eg, do not apply heat). Assess results of laboratory tests prior to each infusion and on a regular basis throughout therapy. Monitor therapeutic effectiveness (symptom relief) and adverse response (eg, cardiac toxicity, myelosuppression, peripheral neuropathy) frequently for full course of therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, cardiac function, serum electrolytes, creatinine, uric acid, ALT, AST, bilirubin

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is only administered by intravenous infusion; report immediately any swelling, pain, burning, redness at infusion site or sudden onset of chest pain, breathing or swallowing difficulty or chills. It is important to maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake), and nutrition. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). You may experience nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or loss of hair (reversible). Urine may turn darker (normal). Report immediately chest pain, swelling of extremities, respiratory difficulty, palpitations, or rapid heartbeat. Report unresolved nausea, vomiting, or diarrhea; alterations in urinary pattern (increased or decreased); opportunistic infection (eg, fever, chills, unusual bruising or bleeding, signs of infection fatigue, purulent vaginal discharge, unhealed mouth sores); abdominal pain or blood in stools; excessive fatigue; yellowing of eyes or skin; swelling of extremities; respiratory difficulty; or unresolved diarrhea. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for use appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride [preservative free] (Idamycin PFS®): 1 mg/mL (5 mL, 10 mL, 20 mL)

Generic AvailableYes

Mechanism of ActionSimilar to doxorubicin and daunorubicin; inhibition of DNA and RNA synthesis by intercalation between DNA base pairs

Pharmacodynamics/Kinetics

Absorption: Oral: Variable (4% to 77%; mean: ~30%)

Distribution: V_d: 64 L/kg (some reports indicate 2250 L); extensive tissue binding; CSF

Protein binding: 94% to 97%

Metabolism: Hepatic to idarubicinol (pharmacologically active)

Half-life elimination: Oral: 14-35 hours; I.V.: 12-27 hours

Time to peak, serum: 1-5 hours

Excretion:

Oral: Urine (~5% of dose; 0.5% to 0.7% as unchanged drug, 4% as idarubicinol); hepatic (8%)

I.V.: Urine (13% as idarubicinol, 3% as unchanged drug); hepatic (17%)

Medication Safety Issues

Sound-alike/look-alike issues:

Elaprase™ may be confused with Elspar®

Pronunciation(eye dur SUL fase)

U.S. Brand NamesElaprase™

Canadian Brand NamesElaprase™

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsReplacement therapy in mucopolysaccharidosis II (MPS II, Hunter syndrome) for improvement of walking capacity

Dosing: AdultsRefer to pediatric dosing.

Dosing: ElderlyStudies did not include patients ≥65 years.

Dosing: PediatricMPS II: I.V.: Children ≥5 years: 0.5 mg/kg once weekly

Administration: I.V.Administer using an infusion set containing a 0.2 micron filter. Infuse at an initial rate of 8 mL/hour for the first 15 minutes. If tolerated, may increase rate by 8 mL/hour increments every 15 minutes; maximum infusion rate 100 mL/hour. Solution should be infused over 1-3 hours, but rate may be decreased, temporarily stopped, or discontinued based on patient response. Total infusion time should not exceed 8 hours.

Administration: I.V. DetailpH: 6

StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light, do not freeze or shake. Should be used immediately after dilution. However, solution for infusion may be stored under refrigeration for up to 48 hours; administer within 8 hours if stored at room temperature.

ReconstitutionPrior to infusion, dilute total dose in NS 100 mL. Mix gently, do not shake.

CompatibilityStable in NS.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Anaphylactic reactions: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylactic reactions: **[U.S. Boxed Warning]: Serious and sometimes fatal anaphylactic reactions, as well as delayed reactions (24 hours after initial reaction), have occurred. Use with caution in patients with compromised respiratory function or acute respiratory disease; risk of complications may be increased and additional monitoring may be required. Appropriate medical support should be readily available.** Antihistamines, corticosteroids and/or decreased infusion rates may be used to manage subsequent infusions.

- Antibody formation: Development of anti-idursulfase IgG antibodies has been reported in ~50% of patients; may increase incidence of infusion-related reaction.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <5 years of age.

Other warnings/precautions:

- Registry: Patients and healthcare providers are encouraged to participate in the Hunter Outcome Survey, intended to monitor disease progression, patient outcomes. and long-term effects of therapy. For more information, refer to www.elaprase.com or call OnePath^{sm} at 1-866-888-0660.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Hypertension (25%), atrial abnormality (13%)

Central nervous system: Pyrexia (63%), headache (59%), malaise (22%), anxiety (13%), irritability (13%)

Dermatologic: Pruritus (28%), urticaria (16%), pruritic rash (13%), skin disorder (13%)

Gastrointestinal: Dyspepsia (13%)

Local: Abscess (16%), infusion-site edema (13%)

Neuromuscular & skeletal: Arthralgia (31%), limb pain (28%), chest wall musculoskeletal pain (16%), musculoskeletal dysfunction (16%)

Ocular: Visual disturbance (22%)

Respiratory: Wheezing (19%)

Miscellaneous: Antibody development (51%), infusion reactions (15%), superficial injury (13%)

<1: Anaphylaxis, angioedema, cardiac arrhythmia, cyanosis, hypotension, infection, loss of consciousness, pulmonary embolism, respiratory distress, respiratory failure, seizure

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor for infusion-related and hypersensitivity reactions; pulmonary function, oxygen saturation; blood pressure

Nursing: Physical Assessment/MonitoringMeasure patient weight accurately prior to each infusion dosage determined by weight. Assess respiratory status closely prior to and during infusion; risk of complication may be increased in presence of acute disease or compromised respiratory function. Patient should be monitored closely during and following infusion for anaphylactic reaction (can be fatal) and appropriate emergency rescue support should be readily available. Antihistamines, corticosteroids and/or decreased infusion rates may be used to reduce reactions. Assess effectiveness of therapy (relief of symptoms) and adverse reactions at beginning of therapy and periodically with long-term use. Teach patient/caregiver appropriate use, possible side effects, and interventions to reduce side effects, and adverse symptoms to report. Inform patient/caregiver about participation in the voluntary Hunter Outcome Survey.

Patient EducationThis medication will not cure Hunter syndrome, but may reduce symptoms. It can only be given by infusion. You will be monitored closely during infusion. Report immediately and difficulty breathing, abdominal cramping, acute headache or dizziness, chest pain, difficulty swallowing. Between infusions, report abdominal cramping, pain, bleeding, headache, or anxiety, dizziness, palpitations, difficulty breathing, skin rash or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to be pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Elaprase™: 2 mg/mL (5 mL) [extractable volume: 3 mL]

Generic AvailableNo

ManufacturerShire

Mechanism of ActionIdursulfase is a recombinant form of iduronate-2-sulfatase, an enzyme needed to hydrolyze the mucopolysaccharides dermatan sulfate and heparan sulfate in various cells. Accumulation of these polysaccharides can lead to various manifestations of disease, including physical changes, CNS involvement, cardiac, respiratory, and mobility dysfunction. Replacement of this enzyme has been shown to improve walking capacity in patients with a deficiency.

Pharmacodynamics/KineticsHalf-life elimination: 44-48 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause malaise, anxiety, or irritability

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Ifosfamide may be confused with cyclophosphamide

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye FOSS fa mide)

U.S. Brand NamesIfex®

Canadian Brand NamesIfex®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent; Antineoplastic Agent, Alkylating Agent (Nitrogen Mustard)

Use: Labeled IndicationsTreatment of testicular cancer

Use: Unlabeled/InvestigationalTreatment of bladder, breast, cervical, ovarian, pancreatic, and lung cancers; Hodgkin's and non-Hodgkin's lymphoma; acute lymphocytic leukemia; Ewing’s sarcoma, osteosarcoma, and soft tissue sarcomas

Dosing: AdultsRefer to individual protocols.

Antineoplastic: I.V.:

Testicular cancer: 1200 mg/m^2/day for 5 days every 3 weeks

Dose ranges used in other cancers (unlabeled uses):

4000-5000 mg/m^2/day for 1 day every 14-28 days **or**

1000-3000 mg/m^2/day for 2-5 days every 21-28 days

Note: To prevent bladder toxicity, ifosfamide should be given with extensive hydration consisting of at least 2 L of oral or I.V. fluid per day. The dose-limiting toxicity is hemorrhagic cystitis and, therefore, ifosfamide should be used in conjunction with a uroprotective agent, such as mesna.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols.

Antineoplastic (unlabeled use): I.V.:

1200-1800 mg/m^2/day for 3-5 days every 21-28 days **or**

5 g/m^2 once every 21-28 days **or**

3 g/m^2/day for 2 days every 21-28 days

See “Note” in adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosage adjustment guidelines (has not been studied). The following guidelines have been used by some clinicians:

Aronoff, 2007:

Cl_{cr} <10 mL/minute: Children and Adults: Administer 75% of dose

Hemodialysis:

Children: 1 g/m^2 followed by hemodialysis 6-8 hours later

Adults: No supplemental dose needed

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 80% of dose

Cl_{cr} 31-45 mL/minute: Administer 75% of dose

Cl_{cr} <30 mL/minute: Administer 70% of dose

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain dosage adjustment guidelines (has not been studied). The following guidelines have been used by some clinicians (Floyd, 2006): Bilirubin >3 mg/dL: Administer 25% of dose

Dosing: Combination Regimens

Breast cancer: ICE-T

Cervical cancer: BIP

Esophageal cancer: TIP

Head and neck cancer: TIP

Oncology: Bone Marrow - High DoseI.V.: 7.5-16 g/m^2 in divided doses over several days; generally combined with other high-dose chemotherapy

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Administer I.V. over 30 minutes to several hours or continuous intravenous infusion over 5 days.

Administration: I.V. DetailAdequate hydration (at least 2 L/day) of the patient before and for 72 hours after therapy is recommended to minimize the risk of hemorrhagic cystitis.

pH: 6

StorageStore intact vials of powder for injection at room temperature of 20°C to 25°C (68°F to 77°F). Store intact vials of solution under refrigeration at 2°C to 8°C (36°F to 46°F). Reconstituted solutions may be stored under refrigeration for up to 21 days. Solutions diluted for administration are stable for 7 days at room temperature and for 6 weeks under refrigeration.

ReconstitutionDilute powder with SWFI or bacteriostatic SWFI to a concentration of 50 mg/mL. Further dilution in 50-1000 mL D_5W or NS (to a final concentration of 0.6-20 mg/mL) is recommended for I.V. infusion.

CompatibilityStable in D_5LR, D_5NS, D_5W, LR, $^1/_2$NS, NS.

Y-site administration: Compatible: Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, linezolid, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, propofol, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinorelbine. **Incompatible:** Cefepime, methotrexate.

Compatibility in syringe: Compatible: Epirubicin, mesna. **Incompatible:** Mesna with epirubicin.

Compatibility when admixed: Compatible: Carboplatin, carboplatin with etoposide, cisplatin, cisplatin with etoposide, epirubicin, etoposide, fluorouracil, mesna. **Incompatible:** Mesna with epirubicin.

ContraindicationsHypersensitivity to ifosfamide or any component of the formulation; patients with severely depressed bone marrow function

Allergy Considerations

- Nitrogen Mustard Allergy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- CNS toxicity: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hemorrhagic cystitis: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Severe bone marrow suppression may occur (dose-limiting toxicity)**; use with caution in patients with compromised bone marrow reserve; use is contraindicated in patients with severely depressed bone marrow function.
- CNS toxicity: **[U.S. Boxed Warning]: May cause CNS toxicity, including confusion and coma**; usually reversible upon discontinuation of treatment. Encephalopathy (ranging from mild somnolence to hallucinations and/or coma) may occur; risk factors may include hypoalbuminemia, renal dysfunction, and prior history of ifosfamide -induced encephalopathy.
- Hemorrhagic cystitis: **[U.S. Boxed Warning]: Urotoxic side effects, primarily hemorrhagic cystitis, may occur (dose-limiting toxicity)**; hydration (at least 2 L/day) and/or mesna administration will protect against hemorrhagic cystitis.
- Wound healing: May interfere with wound healing.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsIncreased resorptions and embryotoxic effects have been observed in animal studies.

LactationEnters breast milk/not recommended

Adverse Reactions

>10%:

Central nervous system: CNS toxicity or encephalopathy (10% to 30%; includes somnolence, agitation, confusion, delirium, hallucinations, depressive psychosis, incontinence, palsy, diplopia, aphasia, or coma)

Dermatologic: Alopecia (83%)

Endocrine & metabolic: Metabolic acidosis (31%)

Gastrointestinal: Nausea/vomiting (58%), may be more common with higher doses or bolus infusion

Hematologic: Myelosuppression (onset: 7-14 days; nadir: 21-28 days; recovery: 21-28 days), leukopenia (50% to ≤100%; grade 4: ≤50%), thrombocytopenia (20%; grades 3/4: 8%)

Renal: Hematuria (6% to 92%; grade 2 [gross hematuria]: 8% to 12%)

1% to 10%:

Central nervous system: Fever

Hepatic: Bilirubin increased (3%), liver dysfunction (3%), transaminases increased (3%)

Local: Phlebitis (2%)

Renal: Renal impairment (6%)

Miscellaneous: Infection (8%)

<1%, postmarketing, and/or case reports: Acidosis, acute renal failure, acute tubular necrosis, allergic reaction, anemia, anorexia, BUN increased, cardiotoxicity, chronic renal failure, coagulopathy, constipation, creatinine increased, dermatitis, diarrhea, Fanconi syndrome, fatigue, hyper-/hypotension, hyperpigmentation, malaise, nail banding/ridging, nonconvulsive status epilepticus, polyneuropathy, proteinuria, pulmonary fibrosis, renal rickets, renal tubular acidosis, salivation, SIADH, sterility, stomatitis

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%)

Metabolism/Transport Effects**Substrate** of CYP2A6 (major), 2B6 (minor), 2C8 (minor), 2C9 (minor), 2C19 (major), 3A4 (major); **Inhibits** CYP3A4 (weak); **Induces** CYP2C8 (weak), 2C9 (weak)

Drug Interactions

CYP2A6 Inducers (Strong): May increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2A6 Inhibitors (Moderate): May decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2A6 Inhibitors (Strong): May decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Ifosfamide may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease ifosfamide levels.

Monitoring ParametersCBC with differential, hemoglobin, and platelet count, urine output, urinalysis (prior to each dose), liver function, and renal function tests

Nursing: Physical Assessment/MonitoringUse caution in presence of impaired renal function or compromised bone marrow reserve. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased or decreased levels/effects of ifosfamide). See Administration for infusion specifics. To prevent bladder toxicity, maintain adequate hydration for 72 hours prior to infusion to minimize risk of hemorrhagic cystitis (2-3 L/day). Premedicate with antiemetic may be advisable prior to each infusion. Assess vital signs and results of laboratory tests prior to each infusion and regularly during therapy. Monitor therapeutic effectiveness (according to purpose for use) and adverse response (eg, CNS depression or psychoses, hematuria [hemorrhagic cystitis], myelosuppression [anemia]) throughout therapy. Teach patient (or caregiver) possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, urinalysis (prior to each dose), liver and renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by infusion. Report immediately any swelling, redness, or pain at infusion site. Maintain adequate hydration (3-4 L/day of fluids unless instructed to restrict fluid intake) for at least 3 days prior to infusion and each day of therapy. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause loss of hair (reversible, although regrowth hair may be different color or texture); fertility or amenorrhea; nausea or vomiting (small, frequent meals, good mouth care, chewing gum, or sucking lozenges may help - if persistent consult prescriber for antiemetic); headache (consult prescriber for analgesic); or mouth sores (use soft toothbrush or cotton swab for oral care). Report any difficulty or pain with urination; chest pain, rapid heartbeat, or palpitations; CNS changes (eg, hallucinations, confusion, somnolence); unusual rash; persistent nausea or vomiting; swelling of extremities; respiratory difficulty; unusual fatigue; or opportunistic infection (eg, fever, chills, easy bruising or unusual bleeding). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a female to become pregnant. Male/female: Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 g

Ifex®: 1 g, 3 g

Injection, solution: 50 mg/mL (20 mL, 60 mL)

Generic AvailableYes

Mechanism of ActionCauses cross-linking of strands of DNA by binding with nucleic acids and other intracellular structures; inhibits protein synthesis and DNA synthesis

Pharmacodynamics/KineticsPharmacokinetics are dose dependent

Distribution: V_d: 5.7-49 L; does penetrate CNS, but not in therapeutic levels

Protein binding: Negligible

Metabolism: Hepatic to active metabolites isofosforamide mustard, 4-hydroxy-ifosfamide, acrolein, and inactive dichloroethylated and carboxy metabolites; acrolein is the agent implicated in development of hemorrhagic cystitis

Half-life elimination:

High dose (3800-5000 mg/m^2): ~15 hours

Lower dose (1600-2400 mg/m^2): ~7 hours

Excretion:

High dose (5000 mg/m^2): Urine (70% to 86%; 61% as unchanged drug)

Lower dose (1600-2400 mg/m^2): Urine (12% to 18% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation, confusion, and hallucinations are common

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine; barbiturates and chloral hydrate may increase the metabolism of ifosfamide

Index TermsIsophosphamide; NSC-109724; Z4942

Iloprost

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(EYE loe prost)

U.S. Brand NamesVentavis®

Pharmacologic Category[Prostacyclin](); [Prostaglandin](); [Vasodilator]()

Use: Labeled IndicationsTreatment of idiopathic pulmonary arterial hypertension in patients with NYHA Class III or IV symptoms

Dosing: AdultsInhalation: Initial: 2.5 mcg/dose; if tolerated, increase to 5 mcg/dose. Administer 6-9 times daily (dosing at intervals ≥2 hours while awake according to individual need and tolerability). Maintenance dose: 2.5-5 mcg/dose; maximum daily dose: 45 mcg

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentAdjustments are not necessary. Use caution in dialysis patients; may be more susceptible to hypotension.

Dosing: Hepatic ImpairmentUse caution.

Administration: InhalationDo not mix with other medications. For inhalation only via the I-neb™ AAD® System or Prodose® AAD® System. Transfer entire contents of ampul into the medication chamber. Only use 1 mL ampul with I-neb™ AAD® System. After use, discard remainder of the medicine; not for reuse.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsThere are no contraindications listed within the FDA-approved labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Pulmonary edema: If pulmonary edema occurs during administration, discontinue therapy immediately.
- Syncope: Dosage or therapy adjustment may be required if exertional syncope occurs. Use caution with concurrent conditions or medications that may increase risk of syncope.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with active bleeding or at increased risk of bleeding (eg, concomitant anticoagulation); mild inhibitor of platelet aggregation when administered as an aerosol.
- Hepatic impairment: Use with caution in patients with Child-Pugh classes B and C hepatic impairment; inhaled iloprost has not been evaluated in this population. Studies of I.V. administered iloprost in Child-Pugh class B patients have demonstrated an approximate 50% reduction in iloprost clearance.
- Hypotension: Avoid use in patients with hypotension (systolic BP <85 mm Hg).
- Renal impairment: Use with caution in patients on dialysis; inhaled iloprost has not been evaluated in this population. Studies of I.V. administered iloprost in patients on dialysis demonstrated an approximate fivefold increase in iloprost AUC when compared to healthy individuals.
- Respiratory disease: Safety and efficacy have not been established in patients with other concurrent pulmonary diseases (eg, COPD, severe asthma, or acute pulmonary infections); may induce bronchospasm in patients with hyper-reactive airways.

Special populations:

- Pediatrics: Not FDA labeled for use in children.

Other warnings/precautions:

- Administration: Intended for inhalation administration using only the I-neb™ AAD® System or Prodose® AAD® System. Solution should not come in contact with skin or eyes. Monitor vital signs during initiation.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIloprost was shown to be embryolethal or teratogenic in some, but not all, animal studies. There are no adequate or well-controlled studies in pregnant women; use only if clearly needed. Women with pulmonary hypertension are urged to avoid pregnancy.

LactationExcretion in breast milk unknown/ not recommended

Adverse Reactions

>10%:

Cardiovascular: Flushing (27%), hypotension (11%)

Central nervous system: Headache (30%)

Gastrointestinal: Nausea (13%)

Neuromuscular & skeletal: Trismus (12%), jaw pain (12%)

Respiratory: Cough increased (39%)

Miscellaneous: Flu-like syndrome (14%)

≥3% to 10%:

Cardiovascular: Syncope (8%), palpitation (7%)

Central nervous system: Insomnia (8%)

Gastrointestinal: Vomiting (7%), tongue pain (4%)

Hepatic: Alkaline phosphatase increased (6%), GGT increased (6%)

Neuromuscular & skeletal: Back pain (7%), muscle cramps (6%)

Respiratory: Hemoptysis (5%), pneumonia (4%)

<3%: Chest pain, CHF, dizziness, dyspnea, kidney failure, paradoxical reaction (increased PVR), peripheral edema, supraventricular tachycardia

Postmarketing and/or case reports: Bronchospasm, diarrhea, epistaxis, gingival bleeding, wheezing

Drug Interactions

Anticoagulants: Prostacyclin Analogues may enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Antihypertensives: Prostacyclin Analogues may enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Antiplatelet Agents: Prostacyclin Analogues may enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Monitoring Parameters Heart rate, blood pressure, and respiratory rate at baseline, with initiation and dosage adjustments. Monitor for improvements in pulmonary function, improved exercise tolerance, NYHA Class improvement; side effects

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution for oral inhalation [preservative-free]:

Ventavis®: 10 mcg/mL (1 mL, 2 mL) [ampul]

Generic Available No

Manufacturer Actelion Pharmaceuticals US, Inc

Mechanism of Action Acutely, iloprost dilates systemic and pulmonary arterial vascular beds. With longer-term use, alters pulmonary vascular resistance and suppresses vascular smooth muscle proliferation. In addition, it is a mild endogenous inhibitor of platelet aggregation when aerosolized (Beghetti, 2002).

Pharmacodynamics/Kinetics

Duration: 30-60 minutes

Distribution: V_d: 0.7-0.8 L/kg

Protein binding: ~60%, primarily to albumin

Metabolism: Hepatic via beta oxidation of the carboxyl side chain; main metabolite, tetranor-iloprost (inactive in animal studies)

Half-life elimination: 20-30 minutes (effect), 7-9 minutes (elimination)

Time to peak, serum: Within 5 minutes after inhalation

Excretion: Urine (68% as metabolite); feces (12%)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Jaw pain (reported in >10% of patients).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause insomnia

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Iloprost Tromethamine; Prostacyclin PGI_2

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye MAT eh nib)
U.S. Brand NamesGleevec®
Canadian Brand NamesGleevec®
Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor
Use: Labeled IndicationsTreatment of:

Gastrointestinal stromal tumors (GIST) kit-positive (CD117) unresectable and/or metastatic malignant

Philadelphia chromosome-positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (newly-diagnosed)

Ph+ CML in chronic phase in pediatric patients recurring following stem cell transplant or who are resistant to interferon-alpha therapy (**not** an approved use in Canada)

Ph+ CML in blast crisis, accelerated phase, or chronic phase after failure of interferon therapy

Ph+ acute lymphoblastic leukemia (ALL) (relapsed or refractory)

Aggressive systemic mastocytosis (ASM) without D816V c-Kit mutation (or c-Kit mutation status unknown)

Dermatofibrosarcoma protuberans (DFSP) (unresectable, recurrent and/or metastatic)

Hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL)

Myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements

Note: The following use is approved in Canada (not an approved indication in the U.S.):

Ph+ ALL induction therapy (newly diagnosed)

Use: Unlabeled/InvestigationalTreatment of desmoid tumors (soft tissue sarcoma)
Dosing: Adults**Note:** For concurrent use with a strong CYP3A4 enzyme-inducing agent (eg, rifampin, phenytoin), imatinib dosage should be increased by at least 50%.

Ph+ CML: Oral:

Chronic phase: 400 mg once daily; may be increased to 600 mg/day, if tolerated, for disease progression, lack of hematologic response after 3 months, lack of cytogenetic response after 6-12 months, or loss of previous hematologic or cytogenetic response

Canadian labeling and NCCN CML guidelines (v.2.2009): Includes range up to 800 mg/day (400 mg twice daily)

Accelerated phase or blast crisis: 600 mg once daily; may be increased to 800 mg/day (400 mg twice daily), if tolerated, for disease progression, lack of hematologic response after 3 months, lack of cytogenetic response after 6-12 months, or loss of previous hematologic or cytogenetic response

Ph+ ALL (relapsed or refractory): Oral: 600 mg once daily

GIST: Oral: 400 mg once daily; may be increased up to 800 mg/day (400 mg twice daily), if tolerated, for disease progression

ASM with eosinophilia: Oral: Initiate at 100 mg once daily; titrate up to a maximum of 400 mg once daily (if tolerated) for insufficient response to lower dose

ASM without D816V c-Kit mutation or c-Kit mutation status unknown: Oral: 400 mg once daily

DFSP: Oral: 400 mg twice daily

HES/CEL: Oral: 400 mg once daily

HES/CEL with FIP1L1-PDGFRα fusion kinase: Oral: Initiate at 100 mg once daily; titrate up to a maximum of 400 mg once daily (if tolerated) if insufficient response to lower dose

MDS/MPD: Oral: 400 mg once daily

Ph+ ALL (induction, newly diagnosed):*Canadian labeling (not an approved use in the U.S.):* Oral: 600 mg once daily

Dosage adjustment with concomitant strong CYP3A4 inducers: Avoid concomitant use of strong CYP3A4 inducers (eg, dexamethasone, carbamazepine, phenobarbital, phenytoin, rifampin); if concomitant use can not be avoided, increase imatinib dose by at least 50% with careful monitoring.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Notes:** May be administered once daily or in 2 divided doses. Dosage should be increased by at least 50% when used concurrently with a potent CYP3A4 enzyme-inducing agent (ie, rifampin, phenytoin).

Ph+ CML: Children ≥2 years: Oral:

Chronic phase, recurrent or resistant: 260 mg/m^2/day

Chronic phase, newly diagnosed: 340 mg/m^2/day; maximum: 600 mg /day

Dosage adjustment for hepatotoxicity or other nonhematologic adverse reactions: Refer to “Hepatic Impairment” dosing.

Dosage adjustment for hematologic adverse reactions: Refer to dosing adjustment for toxicity.

Dosing: Renal Impairment

Recommendation in the FDA-approved labeling:

Mild impairment (Cl_{cr} 40-59 mL/minute): Maximum recommended dose: 600 mg

Moderate impairment (Cl_{cr} 20-39 mL/minute): Decrease recommended starting dose by 50%; dose may be increased as tolerated; maximum recommended dose: 400 mg

Severe impairment (Cl_{cr} <20 mL/minute): Use caution; a dose of 100 mg/day has been tolerated in severe impairment (case reports)

Canadian labeling recommendation:

Mild impairment (Cl_{cr} 40-59 mL/minute): Use caution; usual minimum recommended effective dose: 400 mg once daily; titrate to efficacy and tolerability

Moderate impairment (Cl_{cr} 20-39 mL/minute): Use caution; usual minimum recommended effective dose: 400 mg once daily; titrate to efficacy and tolerability; the use of 800 mg dose is not recommended

Severe impairment (Cl_{cr} <20 mL/minute): Use is not recommended

Dosing: Hepatic Impairment
Mild-to-moderate impairment: No adjustment necessary

Canadian labeling: GIST: Minimum effective dose: 400 mg once daily

Severe impairment: Reduce dose by 25%

Canadian labeling: GIST: 200 mg dose once daily with titration to 300 mg once daily in the absence of severe toxicity

Hepatotoxicity (during therapy) or other nonhematologic adverse reactions: Withhold treatment until toxicity resolves; may resume if appropriate (depending on initial severity of adverse event)

If elevations of bilirubin >3 times upper limit of normal (ULN) or transaminases (ALT/AST) >5 times ULN occur, withhold treatment until bilirubin <1.5 times ULN or transaminases <2.5 times ULN. Resume treatment at a reduced dose as follows:

Children ≥2 years:

If current dose 260 mg/m^2/day, reduce dose to 200 mg/m^2/day

If current dose 340 mg/m^2/day, reduce dose to 260 mg/m^2/day

Adults:

If current dose 400 mg, reduce dose to 300 mg

If current dose 600 mg, reduce dose to 400 mg

If current dose 800 mg, reduce dose to 600 mg

Dosing: Adjustment for Toxicity
Dosage adjustment for hematologic adverse reactions:

Chronic phase CML (initial dose 400 mg/day in adults or 260-340 mg/m^2/day in children), ASM, MDS/MPD, and HES/CEL (initial dose 400 mg/day), or GIST (initial dose 400 mg or 600 mg): If ANC <1 x 10^9/L and/or platelets <50 x 10^9/L: Withhold until ANC ≥1.5 x 10^9/L and platelets ≥75 x 10^9/L; resume treatment at original starting dose. For recurrent neutropenia or thrombocytopenia, withhold until recovery, and reinstitute treatment at a reduced dose as follows:

Children ≥2 years:

If initial dose 260 mg/m^2/day, reduce dose to 200 mg/m^2/day

If initial dose 340 mg/m^2/day, reduce dose to 260 mg/m^2/day

Adults:

If initial dose 400 mg, reduce dose to 300 mg

If initial dose 600 mg, reduce dose to 400 mg

CML (accelerated phase or blast crisis) and PH+ ALL: Adults (initial dose 600 mg): If ANC <0.5 x 10^9/L and/or platelets <10 x 10^9/L, establish whether cytopenia is related to leukemia (bone marrow aspirate or biopsy). If unrelated to leukemia, reduce dose to 400 mg. If cytopenia persists for an additional 2 weeks, further reduce dose to 300 mg. If cytopenia persists for 4 weeks and is still unrelated to leukemia, withhold treatment until ANC ≥1 x 10^9/L and platelets ≥20 x 10^9/L, then resume treatment at 300 mg.

ASM associated with eosinophilia and HES/CEL with FIP1L1-PDGFRα fusion kinase (starting dose 100 mg/day): If ANC <1 x 10^9/L and/or platelets <50 x 10^9/L: Withhold until ANC ≥1.5 x 10^9/L and platelets ≥75 x 10^9/L; resume treatment at previous dose.

DFSP (initial dose 800 mg/day): If ANC <1 x 10^9/L and/or platelets <50 x 10^9/L , withhold until ANC ≥1.5 x 10^9/L and platelets ≥75 x 10^9/L; resume treatment at reduced dose of 600 mg/day. If depression in neutrophils or platelets recurs, withhold until recovery, and reinstitute treatment with a further dose reduction to 400 mg/day.

Dosing: Combination Regimens

Leukemia, acute lymphocytic: Hyper-CVAD + Imatinib

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Pediatrics

Administration: OralShould be administered with food and a large glass of water. Tablets may be dispersed in water or apple juice (using ~50 mL for 100 mg tablet, ~200 mL for 400 mg tablet); stir until dissolved and use immediately. For daily dosing ≥800 mg, the 400 mg tablets should be used in order to reduce iron exposure.

Dietary ConsiderationsShould be taken with food and a large glass of water to decrease gastrointestinal irritation.

StorageStore at 25°C (77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsThere are no contraindications listed within the FDA-approved manufacturer's labeling.

Canadian labeling: Hypersensitivity to imatinib or any component of the formulation

Allergy Considerations

- Imatinib Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: May cause bone marrow suppression (anemia, neutropenia, and thrombocytopenia). Median duration of neutropenia is 2-3 weeks; median duration of thrombocytopenia is 3-4 weeks.

- Cardiovascular effects: Severe HF and left ventricular dysfunction (LVD) have been reported (rarely), usually in patients with comorbidities and/or risk factors; carefully monitor patients with preexisting cardiac disease or risk factors for heart failure. With initiation of imatinib treatment, cardiogenic shock and/or LVD have been reported in patients with hypereosinophilic syndrome and cardiac involvement (reversible with systemic steroids, circulatory support and temporary cessation of imatinib). Patients with high eosinophil levels and an abnormal echocardiogram or abnormal serum troponin level may benefit from prophylactic systemic steroids with the initiation of imatinib.

- Dermatologic reactions: Severe bullous dermatologic reactions, including erythema multiforme and Stevens-Johnson syndrome, have been reported; reintroduction has been attempted following resolution. Successful resumption at a lower dose (with corticosteroids and/or antihistamine) has been described; however, some patients may experience recurrent reactions.

- Fluid retention/edema: Often associated with fluid retention, weight gain, and edema (probability increases with higher doses and age >65 years); occasionally leading to significant complications, including pleural effusion, pericardial effusion, pulmonary edema, and ascites. Use with caution in patients where fluid accumulation may be poorly tolerated, such as in cardiovascular disease (HF or hypertension) and pulmonary disease.

- GI irritation: May cause GI irritation; take with food and water to minimize irritation. There have been rare reports (including fatalities) of GI perforation.

- Hemorrhage: Severe hemorrhage (grades 3 and 4) has been reported with use, including gastrointestinal hemorrhage and/or tumor hemorrhage. The incidence of hemorrhage is higher in patients with GIST.

- Hepatotoxicity: Hepatotoxicity may occur (may be severe); monitor; therapy interruption or dose reduction may be necessary. Acute liver failure has also been reported.

- Opportunistic infections: Has been associated with development of opportunistic infections.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may require dosage adjustment.
- Renal impairment: Use with caution in patients with renal impairment; may require dosage adjustment.
- Thyroid disease: Hypothyroidism has been reported in thyroidectomy patients (receiving thyroid hormone replacement therapy) during imatinib therapy; monitor.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients receiving concurrent therapy which alters CYP2D6 and/or CYP3A4 activity; may require dosage adjustments.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Geriatric ConsiderationsIncidence of edema and edema-related adverse effects is increased in elderly patients.
Pregnancy Risk FactorD
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Animal studies have demonstrated teratogenic effects and fetal loss. Women of childbearing potential are advised not to become pregnant (female patients and female partners of male patients). Adequate contraception is recommended. Case reports of pregnancies while on therapy (both males and females) include reports of spontaneous abortion, minor abnormalities (hypospadias, pyloric stenosis, and small intestine rotation) at or shortly after birth, and other congenital abnormalities including skeletal malformations, hypoplastic lungs, exomphalos, kidney abnormalities, hydrocephalus, cerebellar hypoplasia, and cardiac defects.

Retrospective case reports of women with CML in complete hematologic response (CHR) with cytogenic response (partial or complete) who interrupted imatinib therapy due to pregnancy, demonstrated a loss of response in some patients while off treatment. At 18 months after treatment reinitiation following delivery, CHR was again achieved in all patients and cytogenic response was achieved in some patients. Cytogenetic response rates may not be at as high as compared to patients with 18 months of uninterrupted therapy (Ault, 2006; Pye, 2008).

LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Cardiovascular: Edema/fluid retention (33% to 86%; grades 3/4: 3% to 13%; includes aggravated edema, anasarca, pericardial effusion, peripheral edema, pulmonary edema and superficial edema); facial edema (DFSP 17%), chest pain (CML 7% to 11%)

Central nervous system: Fatigue (29% to 75%), fever (13% to 41%), headache (20% to 37%), dizziness (10% to 19%), insomnia (10% to 19%), depression (≤15%), anxiety (7% to 12%), chills (≤11%)

Dermatologic: Rash (25% to 50%; grades 3/4: 3% to 9%), pruritus (8% to 19%), alopecia (GIST 12% to 15%)

Endocrine & metabolic: Hypokalemia (CML 6% to 13%)

Gastrointestinal: Nausea (42% to 73%), diarrhea (25% to 58%), vomiting (23% to 58%), abdominal pain (30% to 57%), anorexia (≤36%), weight gain (5% to 32%), dyspepsia (11% to 27%), constipation (9% to 16%), taste disturbance (GIST 3% to 15%), loose stools (GIST 10% to 12%)

Hematologic: Hemorrhage (12% to 53%; grades 3/4: 2% to 19%), neutropenia (grade 3: 7% to 27%; grade 4: 3% to 48%), thrombocytopenia (grade 3: 1% to 31%; grade 4: <1% to 33%), anemia (grade 3: 3% to 42%; grade 4: 1% to 11%), leukopenia (GIST 17% to 20%)

Hepatic: Ascites/pleural effusion (GIST 12% to 15%), hepatotoxicity (6% to 12%; grades 3/4: 3% to 8%)

Neuromuscular & skeletal: Muscle cramps (28% to 62%), musculoskeletal pain (adults 30% to 49%; children 21%), arthralgia (≤40%), joint pain (11% to 31%), myalgia (9% to 32%), back pain (GIST 23% to 26%), weakness (≤21%), rigors (10% to 12%), bone pain (≤11%)

Ocular: Periorbital edema (DFSP 33%; MPD 29%), lacrimation increased (DFSP 25%; GIST 16% to 18%)

Renal: Serum creatinine increased (≤11%; grade 3: ≤3%; DFSP: grade 4: 8%)

Respiratory: Nasopharyngitis (10% to 31%), cough (14% to 27%), dyspnea (≤21%), upper respiratory tract infection (3% to 21%), pharyngolaryngeal pain (7% to 18%), rhinitis (DFSP 17%), pharyngitis (CML 10% to 15%), pneumonia (CML 4% to 13%), sinusitis (4% to 11%)

Miscellaneous: Night sweats (CML 13% to 17%), infection without neutropenia (GIST 16% to 17%), influenza (1% to 14%), diaphoresis (GIST 9% to 13%)

1% to 10%:

Cardiovascular: Flushing

Central nervous system: CNS/cerebral hemorrhage (≤9%), hypoesthesia

Dermatologic: Dry skin, erythema, photosensitivity reaction

Endocrine & metabolic: Albumin decreased (grade 3: ≤4%)

Gastrointestinal: Flatulence (≤10%), stomatitis/mucositis (≤10%), gastrointestinal hemorrhage (2% to 8%), abdominal distension, gastritis, gastroesophageal reflux, mouth ulceration, weight loss, xerostomia

Hematologic: Lymphopenia (GIST 6% to 10%), neutropenic fever, pancytopenia

Hepatic: Alkaline phosphatase increased (grade 3: ≤6%; grade 4: <1%), ALT increased (grade 3: 2% to 7%; grade 4: <1%), AST increased (grade 3: 2% to 4%; grade 4: ≤3%), bilirubin increased (grade 3: 1% to 4%; grade 4: ≤3%)

Neuromuscular & skeletal: Joint swelling, paresthesia

Ocular: Blurred vision, conjunctival hemorrhage, conjunctivitis, dry eyes, eyelid edema

Respiratory: Epistaxis

Miscellaneous: Tumor hemorrhage (GIST 1% to 4%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute febrile neutropenic dermatosis (Sweet’s syndrome), amylase increased, anaphylactic shock, angina, angioedema, aplastic anemia, arrhythmia, ascites, atrial fibrillation, avascular necrosis, blepharitis, breast enlargement, bullous eruption, cardiac arrest, cardiac failure, cardiac tamponade, cardiogenic shock, cataract, cellulitis, cerebral edema, cheilitis, CHF (severe), colitis, confusion, CPK increased, dehydration, diverticulitis, dysphagia, embolism, eosinophilia, erythema multiforme, esophagitis, exanthematous pustulosis (acute generalized), exfoliative dermatitis, fungal infection, gastric ulcer, gastroenteritis, gastrointestinal obstruction, gastrointestinal perforation, glaucoma, gout, hearing loss, hematoma, hematemesis, hematuria, hemolytic anemia, hepatic failure, hepatic necrosis, hepatitis, herpes simplex, herpes zoster, hip osteonecrosis, hypercalcemia, hyperglycemia, hyperkalemia, hyperuricemia, hyper-/hypotension, hypomagnesemia, hyponatremia, hypophosphatemia, ileus, inflammatory bowel disease, interstitial lung disease, interstitial pneumonitis, intracranial pressure increased, jaundice, LDH increased, left ventricular dysfunction, leukocytoclastic vasculitis, libido decreased, lichen planus, lichenoid keratosis, lymphadenopathy, macular edema, melena, memory impairment, menorrhagia, MI, migraine, optic neuritis, palpitation, pancreatitis, papilledema, pericarditis, peripheral neuropathy, petechiae, pleural effusion, pleuritic pain, pulmonary fibrosis, pulmonary hemorrhage, pulmonary hypertension, purpura, pustular rash, Raynaud's phenomenon, renal failure, respiratory failure, respiratory tract (lower) infection, retinal hemorrhage, sciatica, scleral hemorrhage, seizure, sepsis, sexual dysfunction, skin pigment changes, somnolence, Stevens-Johnson syndrome, syncope, tachycardia, thrombocythemia, thrombosis, tinnitus, toxic epidermal necrolysis, tremor, tumor necrosis, urinary tract infection, urticaria, vertigo, vesicular rash, vitreous hemorrhage

Oncology: Emetic PotentialModerate (30% to 60%)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2D6 (minor), 2C9 (minor), 2C19 (minor), 3A4 (major), **Inhibits** CYP2C9 (weak), 2D6 (moderate), 3A4 (strong)

Drug Interactions

Acetaminophen: Imatinib may increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CycloSPORINE: Imatinib may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Lansoprazole: May enhance the dermatologic adverse effect of Imatinib. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Simvastatin: Imatinib may decrease the metabolism of Simvastatin. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: BCRP/ABCG2 Inhibitors may increase the serum concentration of Topotecan. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Warfarin: Imatinib may enhance the anticoagulant effect of Warfarin. Imatinib may decrease the metabolism of Warfarin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol.

Food: Food may reduce gastrointestinal irritation. Avoid grapefruit juice (may increase imatinib plasma concentration).

Herb/Nutraceutical: Avoid St John's wort (may increase metabolism and decrease imatinib plasma concentration).

Monitoring ParametersCBC (weekly for first month, biweekly for second month, then periodically thereafter), liver function tests (at baseline and monthly or as clinically indicated), renal function, serum electrolytes (including calcium, phosphorus, potassium and sodium levels); thyroid function tests (in thyroidectomy patients); fatigue, weight, and edema/fluid status; consider echocardiogram and serum troponin levels in patients with HES/CEL, and in patients with MDS/MPD or ASM with high eosinophil levels; in pediatric patients, also monitor serum glucose and albumin

Monitor for signs/symptoms of CHF in patients with at risk for cardiac failure or patients with pre-existing cardiac disease. In Canada, a baseline evaluation of left ventricular ejection fraction is recommended prior to initiation of imatinib therapy in all patients with known underlying heart disease or in elderly patients.

Nursing: Physical Assessment/MonitoringUse caution when fluid accumulation may be poorly tolerated (CHF, hypertension), cardiac or pulmonary disease, or renal or hepatic impairment. Assess closely any other pharmacological agents or herbal products patient may be taking for effectiveness and possible interactions prior to beginning therapy (especially those drugs affected by cytochrome P450 actions). Assess results of laboratory tests on a regular basis (eg, CBC, LFTs, renal and thyroid function tests, calcium and phosphorus levels). Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and regularly during therapy (eg, weight and fluid status, hemorrhage, paresthesia, respiratory or CNS changes). Teach appropriate use, interventions to reduce side effects, and symptoms to report.

Monitoring: Lab TestsCBC (weekly for first month, biweekly for second month, then periodically thereafter), liver function tests (at baseline and monthly or as clinically indicated), renal function, serum electrolytes (including calcium, phosphorus, potassium and sodium levels); thyroid function tests (in thyroidectomy patients); consider echocardiogram and serum troponin levels in patients with HES/CEL, and in patients with MDS/MPD or ASM with high eosinophil levels; in pediatric patients, also monitor serum glucose and albumin

In Canada, a baseline evaluation of left ventricular ejection fraction is recommended prior to initiation of imatinib therapy in all patients with known underlying heart disease or in elderly patients.

Patient EducationDo not take any new prescription or OTC medications, or herbal products during therapy without consulting prescriber. Take exactly as directed with food or a large glass of water. If you have difficulty swallowing tablets, tablet(s) may be dispersed in water or apple juice (using 50 mL of fluid for 100 mg tablet; 200 mL fluid for 400 mg tablet), stir until dissolved and use immediately. Avoid alcohol and chronic use of acetaminophen or aspirin unless approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be required to have regularly scheduled laboratory tests while on this medication. You will be more susceptible to infection (avoid crowds and exposure to infection and do not receive any vaccination unless approved by prescriber). You may experience headache or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug in known); loss of appetite, nausea, vomiting, or mouth sores (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea). Report immediately any chest pain, palpitations, or swelling of extremities; unusual cough, respiratory difficulty, or wheezing; weight gain >5 lb; skin rash; muscle or bone pain, tremors, or cramping; persistent fatigue or weakness; easy bruising or unusual bleeding (eg, tarry stools, blood in vomitus, stool, urine, or mouth); persistent GI problems or pain; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant (female) or cause a pregnancy (male) while taking this medication. Consult prescriber for appropriate contraception. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Gleevec®: 100 mg; 400 mg

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Tablets (Gleevec)

100 mg (30): $906.27

400 mg (30): $3984.06

Mechanism of ActionInhibits Bcr-Abl tyrosine kinase, the constitutive abnormal gene product of the Philadelphia chromosome in chronic myeloid leukemia (CML). Inhibition of this enzyme blocks proliferation and induces apoptosis in Bcr-Abl positive cell lines as well as in fresh leukemic cells in Philadelphia chromosome positive CML. Also inhibits tyrosine kinase for platelet-derived growth factor (PDGF), stem cell factor (SCF), c-Kit, and cellular events mediated by PDGF and SCF.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: Parent drug and metabolite: ~95% to albumin and alpha$_1$-acid glycoprotein

Metabolism: Hepatic via CYP3A4 (minor metabolism via CYP1A2, CYP2D6, CYP2C9, CYP2C19); primary metabolite (active): N-demethylated piperazine derivative (CGP74588); severe hepatic impairment (bilirubin >3-10 times ULN) increases AUC by 45% to 55% for imatinib and its active metabolite, respectively

Bioavailability: 98%

Half-life elimination: Adults: Parent drug: ~18 hours; N-desmethyl metabolite: ~40 hours; Children: Parent drug: ~15 hours

Time to peak: 2-4 hours

Excretion: Feces (68% primarily as metabolites, 20% as unchanged drug); urine (13% primarily as metabolites, 5% as unchanged drug)

Related Information

- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsPatients with HES/CEL, MDS/MPD or ASM with an abnormal echocardiogram or abnormal serum troponin level may benefit from prophylactic systemic steroids (1-2 mg/kg for 1-2 weeks) with the initiation of imatinib.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulceration and taste disturbance.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may infrequently cause depression, anxiety, insomnia, somnolence, migraine, and memory impairment; may rarely cause confusion and convulsions

Mental Health: Effects on Psychiatric TreatmentGastrointestinal irritation is common; use caution with lithium, valproic acid, and SSRIs. May cause hepatotoxicity; use caution with valproic acid and olanzapine. May cause neutropenia or thrombocytopenia; use caution with clozapine, carbamazepine, and valproic acid. Imatinib may inhibit the metabolism of alprazolam, carbamazepine, clozapine, diazepam, fluoxetine, haloperidol, nefazodone, phenothiazines (avoid thioridazine and mesoridazine), sertraline, TCAs, trazodone, and triazolam resulting in elevated serum levels. Fluoxetine and nefazodone may inhibit the metabolism of imatinib. Carbamazepine, St John's wort, and phenobarbital may increase the metabolism of imatinib.

Medication Safety Issues

Sound-alike/look-alike issues:

Cerezyme® may be confused with Cerebyx®, Ceredase®

Pronunciation(i mi GLOO ser ace)
U.S. Brand NamesCerezyme®
Canadian Brand NamesCerezyme®
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsLong-term enzyme replacement therapy for patients with Type 1 Gaucher's disease
Dosing: AdultsGaucher's disease: I.V.: Initial: 30-60 units/kg every 2 weeks; dosing is individualized based on disease severity. Dosing range: 2.5 units/kg 3 times/week up to as much as 60 units/kg administered as frequently as once a week or as infrequently as every 4 weeks. Average dose: 60 units/kg administered every 2 weeks.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥2 years: Refer to adult dosing.
Administration: I.V.I.V.: Infuse over 1-2 hours; may use an in-line, low protein-binding 0.2 micron filter during infusion
StoragePrior to reconstitution, store at 2°C to 8°C (36°F to 46°F). Reconstituted solution is stable for 12 hours at 25°C and at 2°C to 8°C (36°F to 46°F). Do not use if discolored or contains particles. Solution for infusion further diluted in NS is stable for up to 24 hours when stored at 2°C to 8°C (36°F to 46°F).
ReconstitutionVials should be reconstituted with SWFI. Solution for infusion should be further diluted in NS.
ContraindicationsHypersensitivity to imiglucerase or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Have been reported (<1%). Most patients have continued treatment with pretreatment (antihistamines and/or corticosteroids) and a slower rate of infusion. Use caution in patients with previous hypersensitivity to or who have developed antibodies to alglucerase.

- Antibody formation: Development of IgG antibodies has been reported in ~15% of patients; may increase risk of hypersensitivity reactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age (limited experience).

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%: Miscellaneous: Hypersensitivity reaction (7%; symptoms may include pruritus, flushing, urticaria, angioedema, bronchospasm)

Individual frequency not defined, but <1.5%:

Cardiovascular: Tachycardia

Central nervous system: Headache, dizziness, fatigue, fever

Dermatologic: Rash, pruritus

Gastrointestinal: Nausea, abdominal discomfort, vomiting, diarrhea

Local: Injection site burning, swelling, or sterile abscess (<1%)

Neuromuscular & skeletal: Backache

Miscellaneous: Anaphylactoid reactions (<1%)

Postmarketing and/or case reports: Dyspnea, peripheral edema, pulmonary hypertension

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersCBC, platelets, liver function tests, IgG antibody formation, acid phosphatase (AP); MRI or CT of liver and spleen, skeletal x-rays, physical exam every 6-12 months
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Cerezyme®: 200 units, 400 units [derived from Chinese hamster cells; contains mannitol and polysorbate 80]

Generic AvailableNo

Mechanism of ActionImiglucerase is an analogue of glucocerebrosidase; it is produced by recombinant DNA technology using mammalian cell culture. Glucocerebrosidase is an enzyme deficient in Gaucher's disease. It is needed to catalyze the hydrolysis of glucocerebroside to glucose and ceramide.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.09-0.15 L/kg

Half-life elimination: 3.6-10.4 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Imipenem may be confused with ertapenem, meropenem

Primaxin® may be confused with Premarin®, Primacor®

Pronunciation(i mi PEN em & sye la STAT in)
U.S. Brand NamesPrimaxin®
Canadian Brand NamesPrimaxin®; Primaxin® I.V.
Pharmacologic CategoryAntibiotic, Carbapenem
Use: Labeled IndicationsTreatment of lower respiratory tract, urinary tract, intra-abdominal, gynecologic, bone and joint, skin and skin structure, and polymicrobic infections as well as bacterial septicemia and endocarditis. Antibacterial activity includes resistant gram-negative bacilli (*Pseudomonas aeruginosa* and *Enterobacter* sp), gram-positive bacteria (methicillin-sensitive *Staphylococcus aureus* and *Streptococcus* sp) and anaerobes.
Use: Unlabeled/InvestigationalHepatic abscess; neutropenic fever; melioidosis
Dosing: AdultsDoses based on **imipenem** content. **Note:** I.M. administration is not intended for severe or life-threatening infections (eg, septicemia, endocarditis, shock), UTI, bone/joint or polymicrobic infections. For adults weighing <70 kg, refer to Dosing Adjustment in Renal Impairment:

Burkholderia mallei (melioidosis) (unlabeled use): I.V.: 20 mg/kg (up to 1 g) every 6-8 hours for 10 days

Intra-abdominal infections:

I.V.: Mild infection: 250-500 mg every 6 hours; severe: 500 mg every 6 hours

I.M.: Mild-to-moderate infection: 750 mg every 12 hours

Liver abscess (unlabeled use): I.V.: 500 mg every 6 hours for 2-3 weeks, then appropriate oral therapy for a total of 4-6 weeks

Lower respiratory tract, skin/skin structure, gynecologic infections: I.M.: Mild/moderate: 500-750 mg every 12 hours

Moderate infections:

I.M.: 750 mg every 12 hours

I.V.:

Fully-susceptible organisms: 500 mg every 6-8 hours

Moderately-susceptible organisms: 500 mg every 6 hours or 1 g every 8 hours

Neutropenic fever (unlabeled use): I.V.: 500 mg every 6 hours

***Pseudomonas* infections:** I.V.: 500 mg every 6 hours; **Note:** Higher doses may be required based on organism sensitivity.

Severe infections: I.V.: **Note:** I.M. administration is not intended for severe or life-threatening infections (eg, septicemia, endocarditis, shock):

Fully-susceptible organisms: 500 mg every 6 hours

Moderately-susceptible organisms: 1 g every 6-8 hours

Maximum daily dose should not exceed 50 mg/kg or 4 g/day, whichever is lower

Urinary tract infection, uncomplicated: I.V.: 250 mg every 6 hours

Urinary tract infection, complicated: I.V.: 500 mg every 6 hours

Mild infections:Note: Rarely a suitable option in mild infections; normally reserved for moderate-severe cases:

I.M.: 500 mg every 12 hours

I.V.:

Fully-susceptible organisms: 250 mg every 6 hours

Moderately-susceptible organisms: 500 mg every 6 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage based on **imipenem** content:

Non-CNS infections: I.V.:

Neonates ≤3 months and weight ≥1500 g:

<1 week: 25 mg/kg every 12 hours

1-4 weeks: 25 mg/kg every 8 hours

4 weeks to 3 months: 25 mg/kg every 6 hours

Children: >3 months: 15-25 mg/kg every 6 hours

Maximum dosage: Susceptible infections: 2 g/day; moderately-susceptible organisms: 4 g/day

Burkholderia mallei (melioidosis) (unlabeled use): 20 mg/kg every 8 hours for 10 days

Cystic fibrosis: Doses up to 90 mg/kg/day have been used

Dosing: Renal ImpairmentI.V.: **Note:** Adjustments have not been established for I.M. dosing:

Patients with a Cl_{cr} ≤5 mL/minute/1.73 m^2 should not receive imipenem/cilastatin unless hemodialysis is instituted within 48 hours.

Patients weighing <30 kg with impaired renal function should not receive imipenem/cilastatin.

Hemodialysis: Use the dosing recommendation for patients with a Cl_{cr} 6-20 mL/minute; administer dose after dialysis session and every 12 hours thereafter

Peritoneal dialysis: Dose as for Cl_{cr} 6-20 mL/minute.

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 250 mg every 6 hours or 500 mg every 8 hours

CVVHD/CVVHDF: 250 mg every 6 hours or 500 mg every 6-8 hours

Note: Data suggest that 500 mg every 12 hours may provide sufficient T>MIC to cover organisms with MIC values ≤2 mg/L; however, a higher dose of 500 mg every 6 hours is recommended for resistant organisms (particularly *Pseudomonas*) with MIC ≥4 mg/L (Fish, 2005).

See table.

Imipenem and Cilastatin Dosage in Renal Impairment

Reduced I.V. Dosage Regimen Based on **Creatinine Clearance (mL/minute/1.73 m^2) and/or Body Weight <70 kg**					
	Body Weight (kg)				
	≥70	**60**	**50**	**40**	**30**
Total daily dose for normal renal function: 1 g/day					
Cl_{cr} ≥71	250 mg q6h	250 mg q8h	125 mg q6h	125 mg q6h	125 mg q8h
Cl_{cr} 41-70	250 mg q8h	125 mg q6h	125 mg q6h	125 mg q8h	125 mg q8h
Cl_{cr} 21-40	250 mg q12h	250 mg q12h	125 mg q8h	125 mg q12h	125 mg q12h
Cl_{cr} 6-20	250 mg q12h	125 mg q12h	125 mg q12h	125 mg q12h	125 mg q12h
Total daily dose for normal renal function: 1.5 g/day					
Cl_{cr} ≥71	500 mg q8h	250 mg q6h	250 mg q6h	250 mg q8h	125 mg q6h

Cl cr 41-70	250 mg q6h	250 mg q8h	250 mg q8h	125 mg q6h	125 mg q8h
Cl cr 21-40	250 mg q8h	250 mg q8h	250 mg q12h	125 mg q8h	125 mg q8h
Cl cr 6-20	250 mg q12h	250 mg q12h	250 mg q12h	125 mg q12h	125 mg q12h
Total daily dose for normal renal function: 2 g/day

Cl cr 41-70	500 mg q8h	250 mg q6h	250 mg q6h	250 mg q8h	125 mg q6h
Cl cr 21-40	250 mg q6h	250 mg q8h	250 mg q8h	250 mg q12h	125 mg q8h
Cl cr 6-20	250 mg q12h	250 mg q12h	250 mg q12h	250 mg q12h	125 mg q12h
Total daily dose for normal renal function: 3 g/day					
Cl cr ≥71	1000 mg q8h	750 mg q8h	500 mg q6h	500 mg q8h	250 mg q6h
Cl cr 41-70	500 mg q6h	500 mg q8h	500 mg q8h	250 mg q6h	250 mg q8h
Cl cr 21-40	500 mg q8h	500 mg q8h	250 mg q6h	250 mg q8h	250 mg q8h
Cl cr 6-20	500 mg q12h	500 mg q12h	250 mg q12h	250 mg q12h	250 mg q12h
Total daily dose for normal renal function: 4 g/day					
Cl cr ≥71	1000 mg q6h	1000 mg q8h	750 mg q8h	500 mg q6h	500 mg q8h
Cl cr 41-70	750 mg q8h	750 mg q8h	500 mg q6h	500 mg q8h	250 mg q6h
Cl cr 21-40	500 mg q6h	500 mg q8h	500 mg q8h	250 mg q6h	250 mg q8h
Cl cr 6-20	500 mg q12h	500 mg q12h	500 mg q12h	250 mg q12h	250 mg q12h

Dosing: Hepatic ImpairmentHepatic dysfunction may further impair cilastatin clearance; consider decreasing the dosing frequency.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.**Note:** I.M. administration is not intended for severe or life-threatening infections (eg, septicemia, endocarditis, shock). Administer by deep injection into a large muscle (gluteal or lateral thigh). **Only the I.M. formulation can be used for I.M. administration.**

Administration: I.V.I.V.: Do not administer I.V. push. Infuse doses ≤500 mg over 20-30 minutes; infuse doses ≥750 mg over 40-60 minutes. **Only the I.V. formulation can be used for I.V. administration.**

Administration: I.V. DetailVial contents must be transferred to 100 mL of infusion solution. If nausea and/or vomiting occur during administration, decrease the rate of I.V. infusion. Do not mix with or physically add to other antibiotics; however, may administer concomitantly.

pH: 6.5-8.5 (buffered)

Dietary ConsiderationsSodium content of 500 mg injection:

I.M.: 32 mg (1.4 mEq)

I.V.: 37.5 mg (1.6 mEq)

StorageImipenem/cilastatin powder for injection should be stored at <25°C (77°F).
I.M.: The I.M. suspension should be used within 1 hour of reconstitution.

I.V.: Reconstituted I.V. solutions are stable for 4 hours at room temperature and 24 hours when refrigerated. Do not freeze.

Reconstitution

I.M.: Prepare 500 mg vial with 2 mL 1% lidocaine (do not use lidocaine with epinephrine). The I.V. formulation does not form a stable suspension in lidocaine and cannot be used to prepare an I.M dose.

I.V.: Prior to use, dilute dose into 100-250 mL of an appropriate solution. Imipenem is inactivated at acidic or alkaline pH. Final concentration should not exceed 5 mg/mL. The I.M. formulation is not buffered and cannot be used to prepare I.V. solutions.

Compatibility**I.V. formulation:**

Variable stability (consult detailed reference) in D_5W, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, $D_{10}W$, mannitol 2.5%, mannitol 5%, mannitol 10%, NS, TPN.

Y-site administration: Compatible: Acyclovir, amifostine, aztreonam, cefepime, cisatracurium, diltiazem, docetaxel, famotidine, fludarabine, foscarnet, gatifloxacin, granisetron, idarubicin, insulin (regular), linezolid, melphalan, methotrexate, ondansetron, propofol, remifentanil, tacrolimus, teniposide, thiotepa, vinorelbine, zidovudine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, etoposide phosphate, fluconazole, gemcitabine, lorazepam, meperidine, midazolam, sargramostim, sodium bicarbonate. **Variable (consult detailed reference):** Filgrastim, TPN.

ContraindicationsHypersensitivity to imipenem/cilastatin or any component of the formulation

I.M. formulation (due to lidocaine diluent) additional contraindications: Hypersensitivity to amide-type anesthetics; severe shock or heart block

Allergy Considerations

- Carbapenem Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Serious hypersensitivity reactions, including anaphylaxis, have been reported (some without a history of previous allergic reactions to beta-lactams).
- CNS effects: Has been associated with CNS adverse effects, including confusional states and seizures (myoclonic); use caution with CNS disorders (eg, brain lesions, history of seizures, or renal impairment). Incidence of seizures may be higher than with other carbapenems.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required in patients with moderate-to-severe renal dysfunction. Increased seizure risk and thrombocytopenia have been reported in patients with significant renal dysfunction.

Special populations:

- Elderly: Lower doses (based upon renal function) are often required in the elderly.
- Pediatrics: Not recommended in pediatric CNS infections due to seizure potential. Safety and efficacy of I.M. administration have not been established in children <12 years of age.

Dosage form specific issues:

- I.M./I.V. preparations: Two different products are available; due to differences in formulation, the I.V. and I.M. preparations **cannot** be interchanged.

Other warnings/precautions:

- I.M. administration: Doses for I.M. administration are mixed with lidocaine; consult Lidocaine information for associated Warnings/Precautions.

Geriatric ConsiderationsImipenem/cilastatin's role is limited to the treatment of infections caused by susceptible multiresistant organism(s) and in patients whose bacterial infection(s) have failed to respond to other appropriate antimicrobials; many of the seizures attributed to imipenem/cilastatin were in elderly patients; dose must be adjusted for creatinine clearance and body weight.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWith the exception of slightly decreased fetal weights at the highest doses in rats and an increase in embryonic loss in cynomolgus monkeys, most animal studies have not shown an increased fetal risk or teratogenic effects. However, due to the adverse events observed in some animal studies, imipenem/cilastatin is classified as pregnancy category C. No adequate and well-controlled studies have been conducted in pregnant women and it is not known whether imipenem can cause fetal harm. Due to pregnancy induced physiologic changes, some pharmacokinetic parameters of imipenem/cilastatin may be altered. Pregnant women have a larger volume of distribution resulting in lower serum peak levels than for the same dose in nonpregnant women. Clearance is also increased.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsImipenem is excreted in human milk. The low concentrations and low oral bioavailability suggest minimal exposure risk to the infant. The manufacturer recommends that caution be exercised when administering imipenem/cilastatin to nursing women, however, most penicillins and carbapenems are safe for use in breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Imipenem and Cilastatin in Pregnancy & Lactation

Adverse ReactionsAdverse reactions reported with use for both I.V. and I.M. formulations in adults, except where noted.

1% to 10%:

Cardiovascular: Tachycardia (infants 2%; adults <1%)

Central nervous system: Seizure (infants 6%; adults <1%)

Dermatologic: Rash (≤1%, children 2%)

Gastrointestinal: Nausea (1% to 2%), diarrhea (children 3% to 4%; adults 1% to 2%), vomiting (≤2%)

Genitourinary: Oliguria/anuria (infants 2%; adults <1%)

Local: Phlebitis/thrombophlebitis (3%), pain at I.M. injection site (1.2%)

<1%, postmarketing and/or case reports: Abdominal pain, abnormal urinalysis, acute renal failure, alkaline phosphatase increased, anaphylaxis, anemia, angioneurotic edema, asthenia, bilirubin increased, bone marrow depression, BUN/creatinine increased, candidiasis, confusion, cyanosis, dizziness, drug fever, dyspnea, encephalopathy, eosinophilia, erythema multiforme, fever, flushing, gastroenteritis, glossitis, hallucinations, headache, hearing loss, hematocrit decreased, hemoglobin decreased, hemolytic anemia, hemorrhagic colitis, hepatitis (including fulminant onset), hepatic failure, hyperchloremia, hyperhidrosis, hyperkalemia, hypersensitivity, hyperventilation, hyponatremia, hypotension, injection site erythema, jaundice, lactate dehydrogenase increased, leukocytosis, leukopenia, myoclonus, neutropenia (including agranulocytosis), palpitation, pancytopenia, paresthesia, pharyngeal pain, polyarthralgia, polyuria, positive Coombs' test, prothrombin time increased, pruritus, pruritus vulvae, pseudomembranous colitis, psychic disturbances, rash, resistant *P. aeruginosa*, salivation increased, somnolence, staining of teeth, Stevens-Johnson syndrome, taste perversion, thoracic spine pain, thrombocythemia, thrombocytopenia, tinnitus, tongue/tooth discoloration, tongue papillar hypertrophy, toxic epidermal necrolysis, transaminases increased, tremor, urine discoloration, urticaria, vertigo

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Ganciclovir: May enhance the adverse/toxic effect of Imipenem. May increase risk of seizures. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Carbapenems. Management: Avoid concomitant use of doripenem and probenecid. *Risk C: Monitor therapy*

Valproic Acid: Carbapenems may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Test InteractionsInterferes with urinary glucose determination using Clinitest®

Monitoring ParametersPeriodic renal, hepatic, and hematologic function tests; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to beginning therapy. Note Administration for I.M. and I.V. specifics. Assess results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse response periodically during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating therapy. Periodically monitor renal, hepatic, and hematologic function.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by injection or infusion. Report immediately any warmth, swelling, pain, or redness at infusion or injection site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals). May cause false test results with Clinitest®; use of another type of glucose testing is preferable. Report immediately any CNS changes (dizziness, hallucinations, anxiety, visual disturbances); swelling of throat, tongue, lips, or face; chills or fever; persistent diarrhea; or unusual discharge or foul-smelling urine.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [I.M.]:

Primaxin®: Imipenem 500 mg and cilastatin 500 mg [contains sodium 32 mg (1.4 mEq)]

Injection, powder for reconstitution [I.V.]:

Primaxin®: Imipenem 250 mg and cilastatin 250 mg [contains sodium 18.8 mg (0.8 mEq)]; imipenem 500 mg and cilastatin 500 mg [contains sodium 37.5 mg (1.6 mEq)]

Generic AvailableNo

ManufacturerMerck & Co

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested. Cilastatin prevents renal metabolism of imipenem by competitive inhibition of dehydropeptidase along the brush border of the renal tubules.

Pharmacodynamics/Kinetics

Absorption: I.M.: Imipenem: 60% to 75%; cilastatin: 95% to 100%

Distribution: Rapidly and widely to most tissues and fluids including sputum, pleural fluid, peritoneal fluid, interstitial fluid, bile, aqueous humor, and bone; highest concentrations in pleural fluid, interstitial fluid, and peritoneal fluid; low concentrations in CSF

Protein binding: Imipenem: 20%; cilastatin: 40%

Metabolism: Imipenem is metabolized in the kidney by dehydropeptidase I; cilastatin prevents imipenem metabolism by this enzyme; cilastatin is partially metabolized renally

Half-life elimination: I.V.: Both drugs: 60 minutes; prolonged with renal impairment; I.M.: Imipenem: 2-3 hours

Time to peak: I.M.: 3.5 hours

Excretion: Both drugs: Urine (~70% as unchanged drug)

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children's Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Imipramine may be confused with amitriptyline, desipramine, Norpramin®

Pronunciation(im IP ra meen)

U.S. Brand NamesTofranil-PM®; Tofranil®

Canadian Brand NamesApo-Imipramine®; Novo-Pramine; Tofranil®

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine)

Use: Labeled IndicationsTreatment of depression; treatment of nocturnal enuresis in children

Use: Unlabeled/InvestigationalAnalgesic for certain chronic and neuropathic pain; panic disorder; attention-deficit/hyperactivity disorder (ADHD)

Dosing: Adults**Depression:**

Outpatients: Initial: 75 mg/day; may increase gradually to 150 mg/day. May be given in divided doses or as a single bedtime dose; maximum: 200 mg/day

Inpatients: Initial: 100-150 mg/day; may increase gradually to 200 mg/day; if no response after 2 weeks, may further increase to 250-300 mg/day. May be given in divided doses or as a single bedtime dose; maximum: 300 mg/day.

Note: Maximum antidepressant effect may not be seen for 2 or more weeks after initiation of therapy.

Dosing: Elderly

Depression: Initial: 25-50 mg at bedtime; may increase every 3 days for inpatients and weekly for outpatients if tolerated to a recommended maximum of 100 mg/day.

Dosing: Pediatric

Depression: Oral:

Children (unlabeled use): 1.5 mg/kg/day with dosage increments of 1 mg/kg every 3-4 days to a maximum dose of 5 mg/kg/day in 1-4 divided doses; monitor carefully especially with doses ≥3.5 mg/kg/day.

Adolescents: Initial: 30-40 mg/day; increase gradually; maximum: 100 mg/day in single or divided doses.

Enuresis: Oral: Children ≥6 years: Initial: 25 mg at bedtime, if inadequate response still seen after 1 week of therapy, increase by 25 mg/day; dose should not exceed 2.5 mg/kg/day or 50 mg at bedtime if 6-12 years of age or 75 mg at bedtime if ≥12 years of age.

Adjunct in the treatment of cancer pain (unlabeled use): Oral: Children: Initial: 0.2-0.4 mg/kg at bedtime; dose may be increased by 50% every 2-3 days up to 1-3 mg/kg/dose at bedtime.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to imipramine (cross-reactivity with other dibenzodiazepines may occur) or any component of the formulation; concurrent use of MAO inhibitors (within 14 days); in a patient during acute recovery phase of MI; pregnancy

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Imipramine is FDA approved for the treatment of nocturnal enuresis in children ≥6 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Imipramine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is high relative to other antidepressants.

- Hematologic effects: TCAs may rarely cause bone marrow suppression; monitor for any signs of infection and obtain CBC if symptoms (eg, fever, sore throat) evident.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is very high relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Photosensitization: Has been associated with photosensitization; avoid excessive exposure to sunlight.

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is high relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk of conduction abnormalities with this agent is high relative to other antidepressants.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose regulation.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation due to concerns of pro-arrhythmogenesis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Recommended to discontinue prior to elective surgery requiring general anesthesia. Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- ECG monitoring: Baseline and periodic assessment recommended with use of higher dosages; should also be considered in elderly patients and/or patients with pre-existing cardiovascular disease.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsOrthostatic hypotension is a concern with this agent, especially in patients taking other medications that may affect blood pressure. May precipitate arrhythmias in predisposed patients; may aggravate seizures. A less anticholinergic antidepressant may be a better choice. Data from a clinical trial comparing fluoxetine to tricyclics suggests that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular diseases.
Pregnancy Risk FactorD
LactationEnters breast milk/not recommended (AAP rates “of concern”)
Adverse ReactionsReported for tricyclic antidepressants in general. Frequency not defined.

Cardiovascular: Arrhythmia, CHF, ECG changes, heart block, hypertension, MI, orthostatic hypotension, palpitation, stroke, tachycardia

Central nervous system: Agitation, anxiety, confusion, delusions, disorientation, dizziness, drowsiness, fatigue, hallucination, headache, hypomania, insomnia, nightmares, psychosis, restlessness, seizure

Dermatologic: Alopecia, itching, petechiae, photosensitivity, purpura, rash, urticaria

Endocrine & metabolic: Breast enlargement, galactorrhea, gynecomastia, increase or decrease in blood sugar, increase or decrease in libido, SIADH

Gastrointestinal: Abdominal cramps, anorexia, black tongue, constipation, diarrhea, epigastric disorders, ileus, nausea, stomatitis, taste disturbance, vomiting, weight gain/loss, xerostomia

Genitourinary: Impotence, testicular swelling, urinary retention

Hematologic: Agranulocytosis, eosinophilia, thrombocytopenia

Hepatic: Cholestatic jaundice, transaminases increased

Neuromuscular & skeletal: Ataxia, extrapyramidal symptoms, incoordination, numbness, paresthesia, peripheral neuropathy, tingling, tremor, weakness

Ocular: Blurred vision, disturbances of accommodation, mydriasis

Otic: Tinnitus

Miscellaneous: Diaphoresis, falling, hypersensitivity (eg, drug fever, edema)

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2B6 (minor), 2C19 (major), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C19 (weak), 2D6 (moderate), 2E1 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Yohimbine: Tricyclic Antidepressants may increase the serum concentration of Yohimbine. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease imipramine levels. Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersMonitor blood pressure and pulse rate prior to and during initial therapy; ECG in older adults, with high doses, and/or in patients with pre-existing cardiovascular disease; evaluate mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); blood levels are useful for therapeutic monitoring

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008); ensure PR interval ≤200 ms, QRS duration ≤120 ms, and QT_c ≤460 ms.

Reference RangeTherapeutic: Imipramine and desipramine: 150-250 ng/mL (SI: 530-890 nmol/L); desipramine: 150-300 ng/mL (SI: 560-1125 nmol/L); Toxic: >500 ng/mL (SI: 446-893 nmol/L); utility of serum level monitoring controversial

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Perform careful cardiovascular assessment prior to initiating therapy. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Assess CNS status and clinical worsening, and be alert for suicidal ideation. Taper dosage slowly when discontinuing (allow 3-4 weeks between discontinuing and starting another antidepressant), if possible. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsECG, CBC

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Take in the evening. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, altered taste, dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); or urinary retention (void before taking medication). Report persistent insomnia; muscle cramping or tremors; chest pain, palpitations, rapid heartbeat, swelling of extremities, or severe dizziness; unresolved urinary retention; rash or skin irritation; yellowing of eyes or skin; pale stools/dark urine; worsening of condition; and suicide ideation. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as pamoate: 75 mg, 100 mg, 125 mg, 150 mg

Tofranil-PM®: 75 mg, 100 mg, 125 mg, 150 mg

Tablet, as hydrochloride: 10 mg, 25 mg, 50 mg

Tofranil®): 10 mg, 25 mg, 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Imipramine Pamoate)

75 mg (30): $402.57

Capsules (Tofranil-PM)

75 mg (30): $482.98

100 mg (30): $447.27

125 mg (30): $503.56

150 mg (30): $496.73

Tablets (Imipramine HCl)

10 mg (30): $13.99

50 mg (30): $17.64

Tablets (Tofranil)

25 mg (30): $155.99

50 mg (30): $167.88

Mechanism of ActionTraditionally believed to increase the synaptic concentration of serotonin and/or norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane. However, additional receptor effects have been found including desensitization of adenyl cyclase, down regulation of beta-adrenergic receptors, and down regulation of serotonin receptors.

Pharmacodynamics/Kinetics

Onset of action: Peak antidepressant effect: Usually after ≥2 weeks

Absorption: Well absorbed

Distribution: Crosses placenta

Metabolism: Hepatic, primarily via CYP2D6 to desipramine (active) and other metabolites; significant first-pass effect

Half-life elimination: 6-18 hours

Excretion: Urine (as metabolites)

- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Long-term treatment with TCAs, such as imipramine, increases the risk of caries by reducing salivation and salivary buffer capacity. In a study by Rundergren, et al, pathological alterations were observed in the oral mucosa of 72% of 58 patients; 55% had new carious lesions after taking TCAs for a median of $5^1/_2$ years. Current research is investigating the use of the salivary stimulant pilocarpine to overcome the xerostomia from imipramine.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Imipramine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health Comment Tricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Plasma concentrations correlate with clinical response. A linear relationship exists.

Index Terms Imipramine Hydrochloride; Imipramine Pamoate

U.S. Brand NamesAldara®

Canadian Brand NamesAldara®

Pharmacologic CategorySkin and Mucous Membrane Agent; Topical Skin Product

Use: Labeled IndicationsTreatment of external genital and perianal warts/condyloma acuminata; nonhyperkeratotic, nonhypertrophic actinic keratosis on face or scalp; superficial basal cell carcinoma (sBCC) with a maximum tumor diameter of 2 cm located on the trunk, neck, or extremities (excluding hands or feet)

Use: Unlabeled/InvestigationalTreatment of common warts

Dosing: Adults**Note:** A rest period of several days may be taken if required by the patient's discomfort or severity of the local skin reaction. Treatment may resume once the reaction subsides.

Perianal warts/condyloma acuminata: Topical: Apply a thin layer 3 times/week on alternative days prior to bedtime and leave on skin for 6-10 hours. Remove by washing with mild soap and water. Continue imiquimod treatment until there is total clearance of the genital/perianal warts for ≤16 weeks.

Actinic keratosis: Topical: Apply twice weekly for 16 weeks to a treatment area on face or scalp (but not both concurrently); apply prior to bedtime and leave on skin for 8 hours. Remove with mild soap and water.

Common warts (unlabeled use): Topical: Apply once daily prior to bedtime.

Superficial basal cell carcinoma: Topical: Apply once daily prior to bedtime, 5 days/week for 6 weeks. Treatment area should include a 1 cm margin of skin around the tumor. Leave on skin for 8 hours. Remove with mild soap and water.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPerianal warts/condyloma acuminata: Topical: Children ≥12 years: Refer to adult dosing.

Note: A rest period of several days may be taken if required by the patient's discomfort or severity of the local skin reaction. Treatment may resume once the reaction subsides.

Administration: Topical

Actinic keratosis: Treatment area should be a single contiguous area (approximately 25 cm^2) on the face or scalp. Both areas should not be treated concurrently. Apply a thin layer to the wart area and rub in until the cream is no longer visible. Avoid contact with the eyes, lips, and nostrils. Do not occlude the application site. Wash hands before and following application. No more than one packet should be applied at each application and no more than 36 packets should be used per 16-week treatment period.

External genital warts: Nonocclusive dressings such as cotton gauze or cotton underwear may be used in the management of skin reactions. Handwashing before and after cream application is recommended. Imiquimod is packaged in single-use packets that contain sufficient cream to cover a wart area of up to 20 cm^2; avoid use of excessive amounts of cream. Instruct patients to apply imiquimod to external or perianal warts; not for vaginal use. Apply a thin layer to the wart area and rub in until the cream is no longer visible. Do not occlude the application site.

Superficial basal cell carcinoma: Treatment area should have a maximum diameter no more than 2 cm on the trunk, neck, or extremities (excluding the hands, feet, and anogenital skin). Treatment area should include a 1 cm margin around the tumor. Apply a thin layer to the wart area (and margin) and rub in until the cream is no longer visible. Avoid contact with the eyes, lips, and nostrils. Do not occlude the application site. Wash hands before and following application. No more than 36 packets should be used during the 6-week treatment period.

StorageStore at 4°C to 25°C (39°F to 77°F); do not freeze.

Warnings/Precautions

Concerns related to adverse effects:

- Inflammatory reactions: Intense inflammatory reactions may occur, and may be accompanied by systemic symptoms (fever, malaise, myalgia); interruption of therapy should be considered.
- Photosensitivity: May increase sunburn susceptibility; patients should protect themselves from the sun and artificial forms of sunlight.

Disease related concerns:

- Actinic keratosis: Appropriate use: Treatment should be limited to areas ≤25 cm^2. Safety and efficacy of repeated use in the same 25 cm^2

area has not been established.

- Basal cell carcinoma: Appropriate use: Should be limited to superficial carcinomas with a maximum diameter of 2 cm. Safety and efficacy in treatment of sBCC lesions of the face, head, and anogenital area, or other subtypes of basal cell carcinoma (including nodular and morpheaform), have not been established.

- Basal cell nevus syndrome: Safety and efficacy have not been established for basal cell nevus syndrome.

- External genital warts: Appropriate use: Has not been evaluated for the treatment of urethral, intravaginal, cervical, rectal, or intra-anal human papilloma viral disease and is not recommended for these conditions.

- Skin inflammatory conditions: Has the potential to exacerbate inflammatory conditions of the skin.

- Xeroderma pigmentosum: Safety and efficacy have not been established for xeroderma pigmentosum.

Special populations:

- Immunocompromised patients: Safety and efficacy have not been established in immunosuppressed patients.

- Pediatrics: Safety and efficacy have not been established in children <12 years of age. Efficacy was not established for molluscum contagiosum in children 2-12 years of age.

Other warnings/precautions:

- Administration: Not intended for oral, intravaginal, or ophthalmic use. Administration is not recommended until tissue is healed from any previous drug or surgical treatment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were noted in some animal studies following oral administration. Safety and efficacy have not been established in pregnant women. A registry has been established for women exposed to imiquimod during pregnancy (800-670-6126).

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Local: Application site reactions are common. Frequency of reactions vary, and are related to the degree of inflammation associated with the treated disease, number of weekly applications, and individual sensitivity.

Edema, erosion/ulceration, erythema, excoriation, flaking, induration, itching, scabbing/crusting, scaling/dryness, vesicles, weeping/exudate

Respiratory: Upper respiratory infection (3% to 15%)

1% to 10%:

Cardiovascular: Chest pain (1%)

Central nervous system: Headache (4% to 8%), fatigue (2%), fever (1% to 2%), anxiety (1%), dizziness (1%)

Dermatologic: Eczema (2%), alopecia (1%)

Gastrointestinal: Diarrhea (3%), dyspepsia (2% to 3%), nausea (1%), vomiting (1%)

Genitourinary: Urinary tract infection (1%)

Local: Bleeding, burning, hypopigmentation, infection, irritation, pain, papule, rash, sensitivity, soreness, stinging, tenderness

Neuromuscular & skeletal: Myalgia (1%), back pain (4%), rigors (1%)

Respiratory: Sinusitis (2% to 7%), rhinitis (3%), pharyngitis (1%), coughing (2%)

Miscellaneous: Squamous cell carcinoma (4%), influenza-like syndrome (1% to 3%), lymphadenopathy (3%)

Postmarketing and/or case reports (limited to important and/or life-threatening): Agitation, anemia, angioedema, arrhythmias, capillary leak syndrome, cardiac failure, cardiomyopathy, cerebrovascular accident, depression, dyspnea, erythema multiforme, exfoliative dermatitis, Henoch-Schönlein purpura syndrome, idiopathic thrombocytopenia purpura, insomnia, ischemia, leukopenia, liver function abnormal, lymphoma, MI, multiple sclerosis aggravated, paresis, proteinuria, pulmonary edema, seizure, syncope, thrombocytopenia, thyroiditis

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 3A4

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersReduction in wart size is indicative of a therapeutic response; patients should be monitored for signs and symptoms of hypersensitivity to imiquimod

Nursing: Physical Assessment/MonitoringMonitor effectiveness of treatment and adverse reactions experienced at the beginning and periodically during therapy. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication will not eliminate nor prevent the transmission of the virus. For external use only; avoid contact with eyes, mouth, nostrils, or vagina. Use only as frequently as directed and apply as instructed. Exposure to sun should be avoided or minimized. Use sunscreen or wear protective clothing if sun exposure is unavoidable. Sexual contact (vaginal, anal, or oral) should be avoided while cream is on skin. May cause pain, itching, redness, burning, flaking, swelling, or scabbing in treated area. If these effects persist or become severe or open sores develop, stop treatment and notify prescriber. Report fever, malaise, myalgia, or flu-like symptoms. Prescriber may recommend a rest period of several days before resuming treatment. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This medication may weaken condoms or vaginal diaphragms; consult prescriber for appropriate forms of protection.

Consult prescriber if breast-feeding.

Apply treatment just prior to sleeping and leave on 6-10 hours. Wash hands thoroughly before and after application. Wash and dry area to be treated before applying cream. After treatment period, remove cream with mild soap and water. Apply a thin layer to external warts and rub in until cream is no longer visible. Avoid use of excessive cream. May cover area with light gauze dressing or cotton underwear; do not apply occlusive dressing.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream:

Aldara®: 5% (12s, 24s) [contains benzyl alcohol; single-dose packets]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Aldara)

5% (24): $524.97

Mechanism of ActionMechanism of action is unknown; however, induces cytokines, including interferon-alpha and others

Pharmacodynamics/Kinetics

Absorption: Minimal; systemic absorption more dependant upon surface area of application as opposed to dose

Excretion: Urine (≤2% of applied dose as imiquimod and metabolites)

Dental Health Professional ConsiderationsImiquimod 5% has been used for actinic cheilitis or keratosis; however, oral ulcerations have been reported as well as other serious side effects associated with its use. Imiquimod use in the treatment of oral papilloma virus remains inadequately studied.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Immune Globulin (Intramuscular)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(i MYUN GLOB yoo lin, IN tra MUS kyoo ler)

U.S. Brand NamesGamaSTAN™ S/D

Canadian Brand NamesBayGam®

Pharmacologic CategoryImmune Globulin

Use: Labeled IndicationsTo provide passive immunity in susceptible individuals under the following circumstances:

Hepatitis A: Within 14 days of exposure and prior to manifestation of disease

Measles: For use within 6 days of exposure in an unvaccinated person, who has not previously had measles

Varicella: When Varicella Zoster Immune Globulin is not available

Rubella: Postexposure prophylaxis (within 72 hours) to reduce the risk of infection in exposed pregnant women who will not consider therapeutic abortion

Immunoglobulin deficiency: To help prevent serious infections

Dosing: Adults

Hepatitis A: I.M.:

Pre-exposure prophylaxis upon travel into endemic areas (hepatitis A vaccine preferred):

0.02 mL/kg for anticipated risk of exposure <3 months

0.06 mL/kg for anticipated risk of exposure ≥3 months

Repeat approximate dose every 5 months if exposure continues

Postexposure prophylaxis: 0.02 mL/kg given within 14 days of exposure. IG is not needed if at least 1 dose of hepatitis A vaccine was given at ≥1 month before exposure

Measles: I.M.:

Prophylaxis, immunocompetent: 0.25 mL/kg/dose (maximum dose: 15 mL) given within 6 days of exposure followed by live attenuated measles vaccine in 5-6 months when indicated

Prophylaxis, immunocompromised: 0.5 mL/kg (maximum dose: 15 mL) immediately following exposure

Rubella: I.M.: Prophylaxis during pregnancy: 0.55 mL/kg/dose within 72 hours of exposure

Varicella: I.M.: Prophylaxis: 0.6-1.2 mL/kg (varicella zoster immune globulin preferred) within 72 hours of exposure

IgG deficiency: I.M.: 0.66 mL/kg/dose every 3-4 weeks. A double dose may be given at onset of therapy; some patients may require more frequent injections.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.M.

Not for I.V. administration. Administer I.M. in the anterolateral aspects of the upper thigh or deltoid muscle of the upper arm. Avoid gluteal region due to risk of injury to sciatic nerve; use upper outer quadrant only. Divide doses >10 mL.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration: I.V.Not for I.V. administration

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F).

ContraindicationsHypersensitivity to immune globulin or any component of the formulation; IgA deficiency; severe thrombocytopenia or coagulation disorders where I.M. injections are contraindicated

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Administration: Not for I.V. administration.

- Skin testing: Skin testing should not be performed as local irritation can occur and be misinterpreted as a positive reaction.

Geriatric ConsiderationsNo special recommendations are made for the elderly, doses are same as recommended for younger adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this product. Immune globulins cross the placenta in increased amounts after 30 weeks gestation.
Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing, angioedema

Central nervous system: Chills, lethargy, fever

Dermatologic: Urticaria, erythema

Gastrointestinal: Nausea, vomiting

Local: Pain, tenderness, muscle stiffness at I.M. site

Neuromuscular & skeletal: Myalgia

Miscellaneous: Hypersensitivity reactions

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test InteractionsSkin tests should **not** be done
Reference RangeImmunoglobulin deficiency: Maintain circulating IgG levels ~200 mg/100 mL plasma to prevent serious infection
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free; solvent detergent-treated]:

GamaSTAN™ S/D: 15% to 18% (2 mL, 10 mL)

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Injection (BayGam)

(2): $32.99

(10): $127.99

Mechanism of ActionProvides passive immunity by increasing the antibody titer and antigen-antibody reaction potential
Pharmacodynamics/Kinetics

Duration: Immune effect: Usually 3-4 weeks

Half-life elimination: 23 days

Time to peak, serum: I.M.: ~48 hours

Related Information

- Immunization Recommendations
- Prophylaxis for Patients Exposed to Common Communicable Diseases

Pharmacotherapy PearlsWhen administering IG for hepatitis A prophylaxis, use should be considered for the following close contacts of persons with confirmed hepatitis A: unvaccinated household and sexual contacts, persons who have shared illicit drugs, regular babysitters, staff and attendees of child care centers, food handlers within the same establishment.

For travelers, IG is not an alternative to careful selection of foods and water; immune globulin can interfere with the antibody response to parenterally administered live virus vaccines. Frequent travelers should be tested for hepatitis A antibody, immune hemolytic anemia, and neutropenia (with ITP, I.V. route is usually used).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Gamimune® N may be confused with CytoGam®

Immune globulin (intravenous) may be confused with hepatitis B immune globulin

Pronunciation(i MYUN GLOB yoo lin, IN tra VEE nus)

U.S. Brand NamesCarimune® NF; Flebogamma®; Gammagard Liquid; Gammagard S/D; Gammar®-P I.V. [DSC]; Gamunex®; Octagam®; Panglobulin® NF [DSC]; Polygam® S/D [DSC]; Privigen™

Canadian Brand NamesGamimune® N; Gammagard Liquid; Gammagard S/D; Gamunex®

Pharmacologic CategoryImmune Globulin

Use: Labeled Indications

Treatment of primary immunodeficiency syndromes (congenital agammaglobulinemia, severe combined immunodeficiency syndromes [SCIDS], common variable immunodeficiency, X-linked immunodeficiency, Wiskott-Aldrich syndrome) (Carimune® NF, Flebogamma®, Gammagard Liquid, Gammagard S/D, Gammar®-P I.V., Gamunex®, Octagam®, Panglobulin® NF, Polygam® S/D, Privigen™)

Treatment of immune (idiopathic) thrombocytopenic purpura (ITP) (Carimune® NF, Gammagard S/D, Gamunex®, Panglobulin® NF, Polygam® S/D, Privigen™)

Prevention of coronary artery aneurysms associated with Kawasaki disease (in combination with aspirin) (Gammagard S/D, Polygam® S/D)

Prevention of bacterial infection in B-cell chronic lymphocytic leukemia (CLL) (Gammagard S/D, Polygam® S/D)

Treatment of chronic inflammatory demyelinating polyneuropathy (CIDP) (Gamunex®)

Use: Unlabeled/InvestigationalPrevention of serious bacterial infections among HIV-infected children with hypogammaglobulinemia (IgG <400 mg/dL) (CDC guidelines); hematopoietic stem cell transplantation (HSCT), to prevent bacterial infections among allogeneic recipients with severe hypogammaglobulinemia (IgG <400 mg/dL) at <100 days post transplant (CDC guidelines); fetal-neonatal alloimmune thrombocytopenia; pregnancy-associated ITP; prevention of gastroenteritis in children; multiple sclerosis (relapsing, remitting when other therapies cannot be used); hemolytic disease of the newborn; HIV-associated thrombocytopenia; acquired hypogammaglobulinemia secondary to malignancy; myasthenia gravis; refractory dermatomyositis/polymyositis

Dosing: AdultsApproved doses and regimens may vary between brands; check manufacturer guidelines. **Note:** Some clinicians dose IVIG on ideal body weight or an adjusted ideal body weight in morbidly obese patients.

Primary immunodeficiency disorders: Adjust dose/frequency based desired IgG levels and clinical response: General dosing range: 200-800 mg/kg per month

Carimune® NF, Panglobulin® NF: 200 mg/kg every 4 weeks. May increase dose to 300 mg/kg every 4 weeks or may increase frequency based on patient response.

Flebogamma®, Gammagard Liquid, Gammagard S/D, Gamunex®, Octagam®, Polygam® S/D: 300-600 mg/kg every 3-4 weeks; adjusted based on dosage and interval in conjunction with monitored serum IgG concentrations

Gamma®-P I.V.: 200-400 mg/kg every 3-4 weeks

Privigen™: 200-800 mg/kg every 3-4 weeks; adjusted based on dosage and interval in conjunction with monitored serum IgG concentrations

B-cell chronic lymphocytic leukemia (CLL) (Gammagard S/D, Polygam® S/D): 400 mg/kg/dose every 3-4 weeks

Chronic inflammatory demyelinating polyneuropathy (CIDP) (Gamunex®): Loading dose: 2000 mg/kg divided over 2-4 consecutive days; Maintenance: 1000 mg/kg/day for 1 day every 3 weeks **or** 500 mg/kg/day for 2 consecutive days every 3 weeks

Immune (idiopathic) thrombocytopenic purpura (ITP):

Carimune® NF, Panglobulin® NF:

Acute: 400 mg/kg/day for 2-5 days

Chronic: 400 mg/kg as needed to maintain platelet count ≥30,000/mm^3 or to control significant bleeding; may increase dose if needed (range: 800-1000 mg/kg)

Gammagard S/D, Polygam® S/D: 1000 mg/kg; adjust additional doses based on patient response or platelet count. Up to 3 separate doses may be administered on alternate days if required.

Gamunex®: 1000 mg/kg/day for 1-2 days, **or** 400 mg/kg/day for 5 days

Privigen™: 1000 mg/kg/day for 2 consecutive days

Kawasaki disease: Initiate IVIG therapy within 10 days of disease onset: Must be used in combination with aspirin: 80-100 mg/kg/day in 4 divided doses for 14 days; when fever subsides, dose aspirin at 3-5 mg/kg once daily for ≥6-8 weeks

AHA guidelines: 2000 mg/kg as a single dose

Gammagard S/D, Polygam® S/D: 1000 mg/kg as a single dose administered over 10 hours, **or** 400 mg/kg/day for 4 days. Begin within 7 days of onset of fever.

Hematopoietic stem cell transplantation with hypogammaglobulinemia (CDC guidelines): 500 mg/kg/week

Unlabeled uses:

Acquired hypogammaglobulinemia secondary to malignancy (unlabeled use): 400 mg/kg/dose every 3 weeks; reevaluate every 4-6 months

Guillain-Barré syndrome (unlabeled use): Various regimens have been used, including:

400 mg/kg/day for 5 days

or

2000 mg/kg in divided doses administered over 2 days

HIV-associated thrombocytopenia (unlabeled use): 1000 mg/kg/day for 2 days

Multiple sclerosis (relapsing-remitting, when other therapies cannot be used) (unlabeled use): 1000 mg/kg per month, with or without an induction of 400 mg/kg/day for 5 days

Myasthenia gravis (severe exacerbation) (unlabeled use): Total dose of 2000 mg/kg over 2-5 days

Refractory dermatomyositis (unlabeled use): 2000 mg/kg per month administered over 2-5 days

Refractory polymyositis (unlabeled use): 2000 mg/kg per course administered over 2-5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricApproved doses and regimens may vary between brands; check manufacturer guidelines. **Note:** Some clinicians dose IVIG on ideal body weight or an adjusted ideal body weight in morbidly obese patients.

Pediatric HIV, prevention of infection (CDC guidelines): I.V.: 400 mg/kg every 2-4 weeks

Primary immunodeficiency disorders: Adjust dose/frequency based desired IgG levels and clinical response: General dosing range: 200-800 mg/kg per month: Children and Adolescents:

Carimune® NF, Panglobulin® NF: 200 mg/kg every 4 weeks. May increase dose to 300 mg/kg every 4 weeks or may increase frequency based on patient response.

Flebogamma®, Gammagard Liquid, Gammagard S/D, Gamunex®, Octagam®, Polygam® S/D: 300-600 mg/kg every 3-4 weeks; adjusted based on dosage and interval in conjunction with monitored serum IgG concentrations

Gamma®-P I.V.: Children and Adolescents: Initial dose: 200 mg/kg every 3-4 weeks

Privigen™: 200-800 mg/kg every 3-4 weeks; adjusted based on dosage and interval in conjunction with monitored serum IgG concentrations

Hematopoietic stem cell transplantation with hypogammaglobulinemia (CDC guidelines):

Children: 400 mg/kg per month; increase dose or frequency to maintain IgG levels >400 mg/dL

Adolescents : Refer to adult dosing.

B-cell chronic lymphocytic leukemia (CLL): Refer to adult dosing.

Guillain-Barré syndrome (unlabeled use): Refer to adult dosing.

Immune (idiopathic) thrombocytopenic purpura (ITP): Refer to adult dosing.

Kawasaki disease: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Avoid use; in patients at risk of renal dysfunction, consider infusion at a rate less than maximum.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.For I.V. use only; for initial treatment, a lower concentration and/or a slower rate of infusion should be used. Refrigerated product should be warmed to room temperature prior to infusion. Some products require filtration; refer to individual product labeling. Antecubital veins should be used, especially with concentrations ≥10% to prevent injection site discomfort.

Administration: I.V. DetailInfuse over 2-24 hours; administer in separate infusion line from other medications; if using primary line, flush with saline prior administration. Decrease dose, rate and/or concentration of infusion in patients who may be at risk of renal failure. Decreasing the rate or stopping the infusion may help relieve some adverse effects (flushing, changes in pulse rate, changes in blood pressure). Epinephrine should be available during administration.

Carimune® NF, Panglobulin® NF: pH 6.4-6.8

Flebogamma®: pH 5-6

Gammagard Liquid: pH 4.6-5.1

Gammagard S/D 5%, Gammar®-P I.V., Polygam® S/D: pH 6.4-7.2

Gamunex®: pH 4.0-4.5

Octagam®: pH 5.1-6.0

Privigen™: pH 4.6-5

Dietary ConsiderationsOctagam® contains sodium 30 mmol/L

StorageStability is dependent upon the manufacturer and brand. Do not freeze.

Carimune® NF, Panglobulin® NF: Prior to reconstitution, store at or below 30°C (86°F). Following reconstitution, store under refrigeration. Begin infusion within 24 hours.

Flebogamma®: Store at 2°C to 25°C (36°F to 77°F).

Gammagard Liquid: Prior to use, store at 2°C to 8°C (36°F to 46°F) for up to 36 months. May store at room temperature of 25°C (77°F) within the first 24 months of manufacturing. Storage time at room temperature varies with length of time previously refrigerated; refer to product labeling for details.

Gammagard S/D, Polygam® S/D: Store at ≤25°C (≤77°F).

Gammar®-P I.V.: Store at ≤25°C (≤77°F).

Gamunex®: May be stored for up to 36 months at 2°C to 8°C (36°F to 46°F); may be stored at ≤25°C (≤77°F) for up to 6 months.

Octagam®: Store at 2°C to 25°C (36°F to 77°F).

Privigen™: Store at ≤25°C (≤77°F); do not freeze (do not use if previously frozen). Protect from light.

ReconstitutionDilution is dependent upon the manufacturer and brand. Gently swirl; do not shake; avoid foaming. Do not mix products from different manufacturers together. Discard unused portion of vials.

Carimune® NF, Panglobulin® NF: Reconstitute with NS, D_5W, or SWFI.

Flebogamma®: Dilution is not recommended.

Gammagard Liquid: May dilute in D_5W only.

Gammagard S/D, Gammar®-P I.V., Polygam® S/D: Reconstitute with SWFI.

Gamunex®:Dilute in D_5W only.

Privigen™: If necessary to further dilute, D_5W may be used.

CompatibilityStable (variable/product dependent) in D_5W, $D_{15}W$, $D_5{}^1/_4NS$; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Fluconazole, sargramostim.

ContraindicationsHypersensitivity to immune globulin or any component of the formulation; selective IgA deficiency; hyperprolinemia (Privigen™)

Warnings/Precautions

Boxed warnings:

- Renal impairment: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.
- Aseptic meningitis: Aseptic meningitis syndrome (AMS) has been reported with intravenous immune globulin administration (rare); may occur with high doses (≥2 g/kg). Syndrome usually appears within several hours to 2 days following treatment; usually resolves within several days after IVIG is discontinued. Patients with a migraine history may be at higher risk for AMS.
- Hemolysis: Intravenous immune globulin has been associated with antiglobulin hemolysis; monitor for signs of hemolytic anemia.

- Hyperproteinemia: Hyperproteinemia, increased serum viscosity, and hyponatremia may occur; distinguish hyponatremia from pseudohyponatremia to prevent volume depletion and further increase in serum viscosity.

- Infusion reactions: Patients should be monitored for adverse events during and after the infusion. Stop administration with signs of infusion reaction (fever, chills, nausea, vomiting, and rarely shock). Risk may be increased with initial treatment, when switching brands of immune globulin, and with treatment interruptions of >8 weeks.

- Pulmonary edema: Monitor for transfusion-related acute lung injury (TRALI); noncardiogenic pulmonary edema has been reported with intravenous immune globulin use. TRALI is characterized by severe respiratory distress, pulmonary edema, hypoxemia, and fever in the presence of normal left ventricular function. Usually occurs within 1-6 hours after infusion.

- Renal impairment: **[U.S. Boxed Warning]: Acute renal dysfunction (increased serum creatinine, oliguria, acute renal failure, osmotic nephrosis) can rarely occur; usually within 7 days of use (more likely with products stabilized with sucrose). Use with caution in the elderly, patients with renal disease, diabetes mellitus, volume depletion, sepsis, paraproteinemia, and nephrotoxic medications due to risk of renal dysfunction.** In patients at risk of renal dysfunction, the rate of infusion and concentration of solution should be minimized. Discontinue if renal function deteriorates.

- Thrombotic events: Thrombotic events have been reported with administration of intravenous immune globulin; use with caution in patients with a history of atherosclerosis or cardiovascular and/or thrombotic risk factors or patients with known/suspected hyperviscosity. Consider a baseline assessment of blood viscosity in patients at risk for hyperviscosity.

Disease-related concerns:

- Fluid overload: High-dose regimens (1000 mg/kg for 1-2 days) are not recommended for individuals with fluid overload or where fluid volume may be of concern.

- Hypovolemia: Patients should not be volume depleted prior to initiation of therapy.

Special populations:

- Elderly: Use with caution in the elderly; may be at increased risk for renal dysfunction.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

- Latex: Packaging of some products may contain natural latex/natural rubber.

- L-proline: Privigen™ contains the stabilizer L-proline and is contraindicated in patients with hyperprolinemia.

- Maltose: Some products may contain maltose, which may result in falsely-elevated blood glucose readings.

- Sorbitol: Some products may contain sorbitol; do not use in patients with fructose intolerance.

- Sucrose: Some products may contain sucrose.

Other warnings/precautions:

- Administration: For intravenous administration only; patients should be adequately hydrated prior to therapy.

- Vaccinations: Response to live vaccinations may be impaired.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Immune globulins cross the placenta in increased amounts after 30 weeks gestation. Intravenous immune globulin has been recommended for use in fetal-neonatal alloimmune thrombocytopenia and pregnancy-associated ITP.
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Cardiovascular: Chest tightness, edema, flushing of the face, hyper-/hypotension, palpitation, tachycardia

Central nervous system: Anxiety, aseptic meningitis syndrome, chills, dizziness, drowsiness, fatigue, fever, headache, irritability, lethargy, lightheadedness, malaise, migraine, pain

Dermatologic: Bruising, petechiae, pruritus, purpura, rash, urticaria

Gastrointestinal: Abdominal cramps, abdominal pain, diarrhea, discomfort, dyspepsia, nausea, sore throat, vomiting

Hematologic: Anemia, autoimmune hemolytic anemia, hematocrit decreased, hemolysis (mild), hemorrhage, thrombocytopenia

Hepatic: Bilirubin increased, LDH increased, liver function test increased

Local: Pain or irritation at the infusion site

Neuromuscular & skeletal: Arthralgia, back or hip pain, leg cramps, muscle cramps, myalgia, neck pain, weakness

Otic: Ear pain

Renal: Acute renal failure, acute tubular necrosis, anuria, BUN increased, creatinine increased, oliguria, proximal tubular nephropathy, osmotic nephrosis

Respiratory: Asthma aggravated, bronchitis, cough, dyspnea, epistaxis, nasal congestion, pharyngeal pain, pharyngitis, rhinitis, rhinorrhea, sinus headache, sinusitis, upper respiratory infection, wheezing

Miscellaneous: Anaphylaxis, diaphoresis, flu-like syndrome, hypersensitivity reactions, infusion reaction

Postmarketing and/or case reports: Apnea, ARDS, autoimmune pure red cell aplasia (PRCA) exacerbation, bronchopneumonia, bronchospasm, bullous dermatitis, cardiac arrest, chest pain, coma, Coombs' test positive, cyanosis, epidermolysis, erythema multiforme, hepatic dysfunction, hypoxemia, leukopenia, loss of consciousness, pancytopenia, papular rash, pulmonary edema, pulmonary embolism, rigors, seizure, Stevens-Johnson syndrome, thromboembolism, transfusion-related acute lung injury (TRALI), tremor, vascular collapse

Oncology: VesicantNo
Oncology: Emetic PotentialLow
Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test InteractionsOctagam® contains maltose. Falsely-elevated blood glucose levels may occur when glucose monitoring devices and test strips utilizing the glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ) based methods are used. Glucose monitoring devices and test strips which utilize the glucose-specific method are recommended. Passively-transferred antibodies may yield false-positive serologic testing results; may yield false-positive direct and indirect Coombs' test.
Monitoring ParametersRenal function, urine output, hemoglobin and hematocrit, platelets (in patients with ITP); infusion-related adverse reactions, anaphylaxis, signs and symptoms of hemolysis; blood viscosity (in patients at risk for hyperviscosity); presence of antineutrophil antibodies (if TRALI is suspected)
Nursing: Physical Assessment/MonitoringAssess for history of previous allergic reactions. Patient should be monitored during infusion for vital sign changes and adverse or allergic reactions. Teach patient adverse symptoms to report.
Monitoring: Lab TestsRenal function, hemoglobin and hematocrit, platelets (in patients with ITP); signs and symptoms of hemolysis; blood viscosity (in patients at risk for hyperviscosity); presence of antineutrophil antibodies (if TRALI is suspected)
Patient EducationThis medication can only be administered by infusion. You will be monitored closely during the infusion. If you experience nausea ask for assistance, do not get up alone. Do not have any vaccinations for the next 3 months without consulting prescriber. Immediately report chills; chest pain, tightness, or rapid heartbeat; acute back pain; or respiratory difficulty during infusion. Also report decrease in urine output, swelling of extremities, unexplained weight gain of >3-5 lb/week; fever and other signs of infection; trouble breathing; increased heart rate, yellowing of skin or eyes, dark urine; stiff neck, severe headache, unexplained drowsiness, or sensitivity to light. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution [preservative free]:

Gammar®-P I.V.: 5 g, 10 g [stabilized with human albumin and sucrose] [DSC]

Injection, powder for reconstitution [preservative free, nanofiltered]:

Carimune® NF: 3 g, 6 g, 12 g [contains sucrose]

Panglobulin® NF: 6 g, 12 g [contains sucrose] [DSC]

Injection, powder for reconstitution [preservative free, solvent detergent-treated]:

Gammagard S/D: 2.5 g, 5 g, 10 g [stabilized with human albumin, glycine, glucose, and polyethylene glycol; packaging may contain natural latex/natural rubber]

Polygam® S/D: 5 g, 10 g [stabilized with human albumin, glycine, glucose, and polyethylene glycol] [DSC]

Injection, solution [preservative free; solvent detergent-treated]:

Gammagard Liquid: 10% (10 mL, 25 mL, 50 mL, 100 mL, 200 mL) [latex free, sucrose free; stabilized with glycine]

Octagam®: 5% (20 mL, 50 mL, 100 mL, 200 mL) [sucrose free; contains sodium 30 mmol/L and maltose]

Injection, solution [preservative free]

Flebogamma®: 5% (10 mL, 50 mL, 100 mL, 200 mL) [contains polyethylene glycol and sorbitol]

Gamunex®: 10% (10 mL, 25 mL, 50 mL, 100 mL, 200 mL) [caprylate/chromatography purified]

Privigen™: 10% (50 mL, 100 mL, 200 mL) [sucrose free]

Generic AvailableNo
Mechanism of ActionReplacement therapy for primary and secondary immunodeficiencies; interference with F_c receptors on the cells of the reticuloendothelial system for autoimmune cytopenias and ITP; possible role of contained antiviral-type antibodies
Pharmacodynamics/Kinetics

Onset of action: I.V.: Provides immediate antibody levels

Duration: Immune effect: 3-4 weeks (variable)

Distribution: V_d: 0.09-0.13 L/kg

Intravascular portion (primarily): Healthy subjects: 41% to 57%; Patients with congenital humoral immunodeficiencies: ~70%

Half-life elimination: IgG (variable among patients): Healthy subjects: 14-24 days; Patients with congenital humoral immunodeficiencies: 26-40 days; hypermetabolism associated with fever and infection have coincided with a shortened half-life

International Brand NamesOctagam (MX); Pentaglobin (MX); Sandoglobulina (MX); Vigam (MX)

Immune Globulin (Subcutaneous)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(i MYUN GLOB yoo lin sub kyoo TAY nee us)

U.S. Brand NamesVivaglobin®

Pharmacologic CategoryImmune Globulin

Use: Labeled IndicationsTreatment of primary immune deficiency (PID)

Dosing: Adults**Note:** Consider premedicating with acetaminophen and diphenhydramine.

Primary immune deficiency: SubQ infusion: 100-200 mg/kg weekly (maximum rate: 20 mL/hour; doses >15 mL should be divided between sites); adjust the dose over time to achieve desired clinical response or target IgG levels

Conversion from I.V. to SubQ: Multiply previous I.V. dose by 1.37, then divide into a weekly regimen by dividing by the previous I.V. dosing interval (eg, if the dosing interval was every 3 weeks, divide by 3); adjust the dose over time to achieve desired clinical response or target IgG levels. SubQ infusion administration should begin 1 week after the last I.V. dose.

Dosing: Elderly Refer to adult dosing.

Dosing: Pediatric

Children ≥2 years: Refer to adult dosing.

Administration: I.V. DetailpH: 6.4-7.2

Administration: OtherSubcutaneous: Initial dose should be administered in a healthcare setting capable of providing monitoring and treatment in the event of hypersensitivity. Using aseptic technique, follow the infusion device manufacturer's instructions for filling the reservoir and preparing the pump. Remove air from administration set and needle by priming. Inject via infusion pump into the abdomen, thigh, upper arm, and/or lateral hip. The maximum rate is 20 mL/hour and maximum volume per injection site is 15 mL (doses >15 mL should be divided and infused into several sites). Select the number of required infusion sites; multiple concurrent injection sites may be achieved with the use of Y-site connection tubing; injection sites must be at least 2 inches apart. After the sites are clean and dry, insert subcutaneous needle and prime administration set. Attach sterile needle to administration set, gently pull back on the syringe to assure a blood vessel has not been inadvertently accessed. Repeat for each injection site; infuse following instructions for the infusion device. Rotate the site(s) weekly. Treatment may be transitioned to the home/home care setting in the absence of adverse reactions.

StorageStore at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake. Store in original box until ready to use. Allow vial(s) to reach room temperature prior to use. The appearance of immune globulin (subcutaneous) may vary from colorless to light brown; do not use if cloudy or contains precipitate.

CompatibilityDo not mix with other products.

ContraindicationsHypersensitivity to immune globulin or any component of the formulation; history of anaphylactic or severe systemic reaction to immune globulin preparations; selective IgA deficiency with known antibody against IgA

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.

- Infusion reactions: Patients should be monitored for adverse events during and after the infusion. Stop administration with signs of infusion reaction (fever, chills, nausea, vomiting, and rarely shock). Risk may be increased with initial treatment, when switching brands of immune globulin, and with treatment interruptions of >8 weeks.

Special populations:

- Pediatrics: Safety and efficacy have not been established for children <2 years of age.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Administration: For subcutaneous administration only; not for I.V. use.

Geriatric ConsiderationsNo clinical data specific to elderly at this time. Use caution and monitor closely.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAdverse reactions can be expected to be similar to those experienced with other immune globulin products; percentages are reported as adverse events per patient; injection site reactions decreased with subsequent infusions

>10%:

Central nervous system: Headache (32% to 48%), fever (3% to 25%)

Dermatologic: Rash (6% to 17%)

Gastrointestinal: Gastrointestinal disorder (5% to 37%), nausea (11% to 18%), sore throat (17%)

Local: Injection site reactions (swelling, redness, itching; 92%)

Miscellaneous: Allergic reaction (11%)

1% to 10%:

Cardiovascular: Tachycardia (3%)

Central nervous system: Pain (10%)

Dermatologic: Skin disorder (3%)

Gastrointestinal: Diarrhea (10%)

Genitourinary: Urine abnormality (3%)

Neuromuscular & skeletal: Weakness (5%)

Respiratory: Cough (10%)

<1%: Abdominal pain, dyspnea, nervousness

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test InteractionsPassively-transferred antibodies may yield false-positive serologic testing results; may yield false-positive direct and indirect Coombs' test

Monitoring ParametersInfusion-related adverse reactions, anaphylaxis, IgG levels, clinical response

Reference RangeAlthough the trough serum concentration of IgG has not been established, clinical experience has led to the use of 500 mg/dL as a guideline.

Nursing: Physical Assessment/MonitoringThis medication can only be administered via SubQ infusion. Assess for history of previous allergic reaction. Monitor for an allergic reaction during infusion; have anaphylaxis kit available. Assess infusion site periodically during infusion. Observe for redness, swelling, or itching. Teach patient adverse symptoms to report. Teach patient appropriate infusion technique if patient is to self administer.

Monitoring: Lab TestsIgG levels

Patient EducationDo not have any vaccinations for at least 3 months unless approved by prescriber. You may experience headache, fever, rash, nausea, diarrhea, cough, or sore throat. Stop infusion and report signs of infusion reaction (fever, chills, nausea, vomiting, and rarely, shock) immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: IgG 160 mg/mL (3 mL, 10 mL, 20 mL)

Generic AvailableNo

ManufacturerZLB Behring GmbH

Mechanism of ActionImmune globulin replacement therapy of IgG antibodies against bacteria and viral agents.

Pharmacodynamics/Kinetics

Bioavailability: 73% (compared to I.V.)

Time to peak, plasma: 2.5 days

Pharmacotherapy PearlsSerum IgG levels may be drawn at any time. Subcutaneous weekly treatments provide more constant levels rather than the more pronounced peak and trough patterns observed with I.V. monthly immune globulin treatments.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache is very common

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, valproic acid, and carbamazepine may produce additive effects

Index TermsImmune Globulin Subcutaneous (Human); SCIG

Inamrinone

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Amrinone may be confused with aMILoride, amiodarone

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye NAM ri none)

Pharmacologic CategoryPhosphodiesterase Enzyme Inhibitor

Use: Labeled IndicationsShort-term therapy in patients with intractable heart failure

Dosing: AdultsDosage is based on clinical response (**Note:** Dose should not exceed 10 mg/kg/24 hours).

Heart failure: 0.75 mg/kg I.V. bolus over 2-3 minutes followed by maintenance infusion of 5-10 mcg/kg/minute; I.V. bolus may need to be repeated in 30 minutes.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHeart failure: Infants and Children (unlabeled populations): Refer to adult dosing.

Dosing: Renal Impairment

Infants and Children:

Cl_{cr} 30-50 mL/minute: Administer 100% of dose

Cl_{cr} 10-29 mL/minute: Administer 50% of dose

Cl_{cr} <10 mL/minute: Administer 25% of dose

Intermittent hemodialysis or peritoneal dialysis: Administer 25% of dose

Adults:

Cl_{cr} ≥10 mL/minute: Administer 100% of dose

Cl_{cr} <10 mL/minute: Administer 50% to 75% of dose

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.

May be administered undiluted for I.V. bolus doses. Dilute for use as continuous infusion.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light. Store in carton until ready for use.

ReconstitutionFor continuous infusion, dilute with 0.45% or 0.9% sodium chloride to final concentration of 1-3 mg/mL. Use within 24 hours. Do not directly dilute with dextrose-containing solutions; chemical interaction occurs. May be administered I.V. into running dextrose infusions.

CompatibilityStable in NS, $^1/_2$NS; **incompatible** in D_5W.

Y-site administration: Compatible: Aminophylline, atropine, bretylium, calcium chloride, cimetidine, cisatracurium, digoxin, dobutamine, dopamine, epinephrine, famotidine, hydrocortisone sodium succinate, isoproterenol, lidocaine, metaraminol, methylprednisolone sodium succinate, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, potassium chloride, propofol, propranolol, remifentanil, verapamil. **Incompatible:** Furosemide, sodium bicarbonate. **Variable (consult detailed reference):** Procainamide.

Compatibility in syringe: Compatible: Propranolol, verapamil.

Compatibility when admixed: Compatible: Propafenone. **Incompatible:** Furosemide.

ContraindicationsHypersensitivity to inamrinone, any component of the formulation, or bisulfites (contains sodium metabisulfite); patients with severe aortic or pulmonic valvular disease

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: Observe for arrhythmias in this very high-risk patient population. Ventricular or atrial arrhythmias may persist even after discontinuation of inamrinone, especially in patients with renal dysfunction. Ensure that ventricular rate is controlled in atrial fibrillation/flutter before initiating therapy; may increase ventricular response rate. In heart transplant candidates, institute appropriate measures to protect patient against risks of sudden cardiac death.

- Hepatic effects: Discontinue therapy if dose-related changes in LFTs and clinical symptoms of hepatotoxicity occur; monitor liver function.

- Hypotension: Monitor blood pressure and heart rate closely. Infusion may require reduction or temporary discontinuation if hypotension occurs. Hypotension may be prolonged especially in patients with renal dysfunction. Vigorous diuresis may contribute to hypotension; cautious administration of fluids may be required to prevent hypotension.

- Thrombocytopenia: Can cause thrombocytopenia (due to decreased platelet survival time). If platelet count falls below 150,000/mm^3, may maintain therapy, decrease daily dose, or discontinue therapy based upon risk versus benefit. Monitor closely.

Disease-related concerns:

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to initiation of and throughout therapy.

- Idiopathic hypertrophic subaortic stenosis (IHSS)/hypertrophic obstructive cardiomyopathy (HOCM): May aggravate this condition.

- Myocardial infarction (MI): Not recommended in acute MI treatment.

Other warnings/precautions:

- Long-term therapy: According to the ACC/AHA chronic heart failure 2005 guidelines, long-term, regularly-scheduled intermittent infusions are strongly discouraged.

- Monitoring: Monitor fluid status closely; patients may require adjustment of diuretic and electrolyte replacement therapy.

Geriatric ConsiderationsWhile inamrinone is not specifically arrhythmogenic, the elderly may be at high risk for ventricular and particularly atrial arrhythmias due to high incidence of arrhythmias in this population. Also, the elderly are often hypovolemic due to dehydration; therefore, monitor fluid status carefully (CVP line) in order to have effective falling pressure for maximal response. Found to be as effective as dobutamine in the elderly with heart failure in one study despite the decline in beta-adrenergic response with age.

Pregnancy Risk FactorC

Adverse Reactions

1% to 10%:

Cardiovascular: Arrhythmias (3%; especially in high-risk patients), hypotension (1% to 2%; dose related)

Gastrointestinal: Nausea (1% to 2%), vomiting (1%)

Hematologic: Thrombocytopenia (~2%; dose related)

<1% (Limited to important or life-threatening): Abdominal pain, anorexia, chest pain, fever, hepatotoxicity, hyperbilirubinemia, hypersensitivity, injection site reactions, jaundice, liver enzymes increased

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersPlatelet count, CBC, electrolytes (especially potassium and magnesium), liver function and renal function tests; ECG, CVP, SBP, DBP, heart rate; infusion site

If pulmonary artery catheter is in place, monitor cardiac index, stroke volume, systemic vascular resistance, pulmonary capillary wedge pressure and pulmonary vascular resistance.

Monitoring: Lab Tests

Platelet count, CBC, electrolytes (especially potassium and magnesium), liver function and renal function tests

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as lactate: 5 mg/mL (20 mL) [contains sodium metabisulfite]

Generic AvailableYes

Mechanism of ActionInhibits myocardial cyclic adenosine monophosphate (cAMP) phosphodiesterase activity and increases cellular levels of cAMP resulting in a positive inotropic effect and increased cardiac output; also possesses systemic and pulmonary vasodilator effects resulting in pre- and afterload reduction; slightly increases atrioventricular conduction

Pharmacodynamics/Kinetics

Onset of action: I.V.: 2-5 minutes

Peak effect: ~10 minutes

Duration (dose dependent): Low dose: ~30 minutes; Higher doses: ~2 hours

Half-life elimination, serum: Adults: Healthy volunteers: 3.6 hours, Congestive heart failure: 5.8 hours

Excretion: Urine (10% to 40% as parent drug)

Related Information

- Hemodynamic Support, Intravenous

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause hypotension which may be exacerbated by psychotropics

Cardiovascular ConsiderationsAlthough the phosphodiesterase inhibitor drugs may induce short-term improvement in clinical status in patients with intractable heart failure, longer-term studies of these drugs in heart failure have suggested that there is a net increase in mortality.

Index TermsAmrinone Lactate

Medication Safety Issues

Sound-alike/look-alike issues:

Indapamide may be confused with Iopidine®

International issues:

Pretanix® [Hungary] may be confused with Protonix® which is a brand name for pantoprazole in the U.S.

Pronunciation(in DAP a mide)

Canadian Brand NamesApo-Indapamide®; Dom-Indapamide; Gen-Indapamide; Lozide®; Lozol®; Novo-Indapamide; Nu-Indapamide; PHL-Indapamide; PMS-Indapamide; Pro-Indapamide; Riva-Indapamide

Pharmacologic CategoryDiuretic, Thiazide-Related

Use: Labeled IndicationsManagement of mild to moderate hypertension; treatment of edema in congestive heart failure and nephrotic syndrome

Dosing: Adults

Edema (diuretic): Oral: 2.5-5 mg/day. **Note:** There is little therapeutic benefit to increasing the dose >5 mg/day; there is, however, an increased risk of electrolyte disturbances.

Hypertension: Oral: 1.25 mg in the morning, may increase to 5 mg/day by increments of 1.25-2.5 mg; consider adding another antihypertensive and decreasing the dose if response is not adequate.

Dosing: ElderlyRefer to adult dosing.

Administration: OralMay be taken with food or milk. Take early in day to avoid nocturia. Take the last dose of multiple doses no later than 6 PM unless instructed otherwise.

Dietary ConsiderationsMay be taken with food or milk to decrease GI adverse effects.

ContraindicationsHypersensitivity to indapamide or any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria; renal decompensation; pregnancy (based on expert analysis)

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with thiazide or sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations.
- Hypokalemia: Use with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Avoid in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Can cause SLE exacerbation or activation.

Other warnings/precautions:

- I.V. use: Generally not recommended, but is available.

Geriatric ConsiderationsThiazide diuretics lose efficacy when Cl_{cr} is <30-35 mL/minute. Many elderly may have Cl_{cr} below this limit. Calculate Cl_{cr} for elderly before initiating therapy. Indapamide has the advantage over thiazide diuretics in that it is effective when Cl_{cr} is <30 mL/minute.

Pregnancy Risk FactorB (manufacturer); D (expert analysis)

LactationExcretion in breast milk unknown

Adverse Reactions

1% to 10%:

Cardiovascular: Orthostatic hypotension, palpitation (<5%), flushing

Central nervous system: Dizziness (<5%), lightheadedness (<5%), vertigo (<5%), headache (≥5%), restlessness (<5%), drowsiness (<5%), fatigue, lethargy, malaise, lassitude, anxiety, agitation, depression, nervousness (≥5%)

Dermatologic: Rash (<5%), pruritus (<5%), hives (<5%)

Endocrine & metabolic: Hyperglycemia (<5%), hyperuricemia (<5%)

Gastrointestinal: Anorexia, gastric irritation, nausea, vomiting, abdominal pain, cramping, bloating, diarrhea, constipation, dry mouth, weight loss

Genitourinary: Nocturia, frequent urination, polyuria, impotence (<5%), reduced libido (<5%), glycosuria (<5%)

Neuromuscular & skeletal: Muscle cramps, spasm, weakness (≥5%)

Ocular: Blurred vision (<5%)

Renal: Necrotizing angiitis, vasculitis, cutaneous vasculitis (<5%)

Respiratory: Rhinorrhea (<5%)

<1% (Limited to important or life-threatening symptoms, and/or postmarketing reports): Hepatitis, hypercalcemia, jaundice, liver function test abnormality, pancreatitis, purpura

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure (both standing and sitting/supine), serum electrolytes, renal function, assess weight, I & O reports daily to determine fluid loss

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy (sulfonamides, thiazides). Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, altered effect of oral hypoglycemics, increased risk of hypotension or toxicity). Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response (hypotension, hypokalemia, confusion) at regular intervals during therapy. Instruct patients with diabetes to monitor glucose levels closely; may interfere with oral hypoglycemic medications. Teach patient proper use, possible side effects (eg, orthostatic hypotension, photosensitivity) and appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, early in the day. Do not exceed recommended dosage. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. If you have diabetes, monitor serum glucose closely (medication may decrease effect of oral hypoglycemics). Monitor weight on a regular basis. Report sudden or excessive weight gain (>5 lb/week), swelling of ankles or hands, or respiratory difficulty. You may experience dizziness, weakness, or drowsiness (use caution when rising from sitting or lying position, when climbing stairs and when driving or engaging in tasks that require alertness until response to drug is known); sensitivity to sunlight (use sunblock, wear protective clothing or sunglasses); impotence (reversible); or dry mouth or thirst (frequent mouth care, chewing gum, or sucking lozenges may help). Report any changes in visual acuity; unusual bleeding; chest pain or palpitations; or numbness, tingling, cramping of muscles. **Pregnancy/breast-feeding precaution:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1.25 mg, 2.5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Indapamide)

1.25 mg (90): $15.00

2.5 mg (30): $13.99

Tablets (Lozol)

1.25 mg (30): $34.85

Mechanism of ActionDiuretic effect is localized at the proximal segment of the distal tubule of the nephron; it does not appear to have significant effect on glomerular filtration rate nor renal blood flow; like other diuretics, it enhances sodium, chloride, and water excretion by interfering with the transport of sodium ions across the renal tubular epithelium

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Duration: ≤36 hours

Absorption: Complete

Protein binding, plasma: 71% to 79%

Metabolism: Extensively hepatic

Half-life elimination: 14-18 hours

Time to peak: 2-2.5 hours

Excretion: Urine (~60%) within 48 hours; feces (~16% to 23%)

Related Information

- Depression
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension, palpitations, flushing, xerostomia (normal salivary flow resumes upon discontinuation), and rhinorrhea.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsIndapamide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay rarely cause mood changes

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsIndapamide may be used to treat hypertension but offers no compelling advantages over thiazide diuretics in this setting.

International Brand NamesAmoron (HR); Apo-Indap (PL); Arifon (PL); Damide (IT); Dapa (MY); Dapa-tabs (AU); Dapamax (TZ, UG, ZA, ZM, ZW); Depermide (TW); Diuresin SR (PL); Dixamid (GR); Extur (ES); Fludex (AT, BE, CH, DK, FR, GR, LU, NL, PT, TR); Fludex SR (KP); Frumeron (TH); Indahexal (AU); Indalix (HK, ZA); Indapam (KP); Indapamid Anpharm (PL); Indapamide-Eurogenerics (LU); Indapamide-Generics (LU); Indapen (PL); Indapres (PL); Indapress (CN); Indapsan (PL); Indicontin Continus (HK); Inpamide (TH); Insig (AU); Intril SR (TH); Ipamix (IT); Lorvas (IN); Magniton-R (GR); Millibar (CL, TW); Napamide (MY, NZ, SG, TH); Natrilix (AE, AR, AU, BF, BH, BJ, BR, CI, CY, DE, EG, ET, FI, GB, GH, GM, GN, HK, ID, IL, IN, IQ, IR, IT, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, MY, NE, NG, NZ, OM, PE, PK, QA, SA, SC, SD, SL, SN, SY, TN, TZ, UG, UY, VE, YE, ZA, ZM, ZW); Natrilix Retard (SE); Natrilix SR (AU, BB, BM, BS, BZ, CL, CO, CR, DE, DO, GT, GY, HN, IE, IN, JM, NI, NL, PA, PH, PY, SG, SR, SV, TT, UY); Natrix SR (KP); Pamid (IL); Pretanix (HU); Rinalix (SG); Sicco (DE); Tandix (PT); Tertensif (BG, CZ, EE, ES, FI, HR, PL); Vazamide SR (PH)

Indinavir

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Indinavir may be confused with Denavir™

Pronunciation(in DIN a veer)

U.S. Brand NamesCrixivan®

Canadian Brand NamesCrixivan®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV infection; should always be used as part of a multidrug regimen (at least three antiretroviral agents)

Dosing: Adults**HIV infection:** Oral:

Unboosted regimen: 800 mg every 8 hours

Ritonavir-boosted regimens:

Ritonavir 100-200 mg twice daily plus indinavir 800 mg twice daily **or**

Ritonavir 400 mg twice daily plus indinavir 400 mg twice daily

Dosage adjustments for indinavir when administered in combination therapy:

Delavirdine, itraconazole, or ketoconazole: Reduce indinavir dose to 600 mg every 8 hours

Efavirenz: Increase indinavir dose to 1000 mg every 8 hours

Lopinavir and ritonavir (Kaletra™): Indinavir 600 mg twice daily

Nelfinavir: Increase indinavir dose to 1200 mg twice daily

Nevirapine: Increase indinavir dose to 1000 mg every 8 hours

Rifabutin: Reduce rifabutin to $^1/_2$ the standard dose plus increase indinavir to 1000 mg every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHIV: Children 4-15 years (investigational): 500 mg/m^2 every 8 hours

Dosing: Hepatic Impairment600 mg every 8 hours with mild/medium impairment due to cirrhosis

Administration: OralDrink at least 48 oz of water daily. Administer with water, 1 hour before or 2 hours after a meal. May also be administered with other liquids (eg, skim milk, juice, coffee, tea) or a light meal (eg, toast, corn flakes). Administer around-the-clock to avoid significant fluctuation in serum levels. May be taken with food when administered in combination with ritonavir.

Dietary ConsiderationsShould be taken without food but with water 1 hour before or 2 hours after a meal. Administration with lighter meals (eg, dry toast, skim milk, corn flakes) resulted in little/no change in indinavir concentration. If taking with ritonavir, may take with food. Patient should drink at least 48 oz of water daily.

StorageMedication should be stored at 15°C to 30°C (59°F to 86°F), and used in the original container and the desiccant should remain in the bottle. Capsules are sensitive to moisture.

ContraindicationsHypersensitivity to indinavir or any component of the formulation; concurrent use of alprazolam, amiodarone, cisapride, triazolam, midazolam (oral), pimozide, or ergot alkaloids

Allergy Considerations

- Indinavir Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hemolytic anemia: Has been associated with hemolytic anemia; discontinue if diagnosed.
- Hyperbilirubinemia: Has been observed frequently. Do not use concurrently with atazanavir.
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Nephrolithiasis/urolithiasis: May cause nephrolithiasis/urolithiasis; discontinue if signs and symptoms occur. Adequate hydration is recommended. Risk is substantially higher in pediatric patients versus adults. Symptoms may require temporary interruption of therapy (1-3 days) or discontinuation.

- Tubulointerstitial nephritis: May cause tubulointerstitial nephritis (rare); severe asymptomatic leukocyturia may warrant evaluation.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.

- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.

- Hepatic impairment: May cause hepatitis and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Pregnancy Risk FactorC

Pregnancy ConsiderationsPlasma levels of indinavir were 74% lower at weeks 30-32 of gestation when compared to the same women at 14-28 weeks of gestation. Plasma levels were not measurable in some patients 8 hours post dose. It is not known if indinavir will exacerbate hyperbilirubinemia in neonates. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Until optimal dosing during pregnancy has been established, the manufacturer does not recommend indinavir use in pregnant patients. The AIDSinfo guidelines consider indinavir an alternative agent if lopinavir/ritonavir cannot be used, however, indinavir should be used in combination with low-dose ritonavir during pregnancy (optimal dosing is not known). Healthcare professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIndinavir is minimally excreted in breast milk. HIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions

>10%:

Gastrointestinal: Abdominal pain (17%), nausea (12%)

Hepatic: Hyperbilirubinemia (14%; dose dependent)

Renal: Nephrolithiasis/urolithiasis, including flank pain with/without hematuria (29%, pediatric patients; 12% adult patients; dose dependent)

1% to 10%:

Central nervous system: Headache (5%), dizziness (3%), somnolence (2%), fever (2%), malaise (2%), fatigue (2%)

Dermatologic: Pruritus (4%), rash (1%)

Endocrine & metabolic: Hyperglycemia (1%)

Gastrointestinal: Vomiting (8%), diarrhea (3%), taste perversion (3%), acid reflux (3%), anorexia (3%), appetite increased (2%), dyspepsia (2%), serum amylase increased (2%)

Hematologic: Neutropenia (2%), anemia (1%), thrombocytopenia (1%)

Hepatic: Transaminases increased (4% to 5%), jaundice (2%)

Neuromuscular & skeletal: Back pain (8%), weakness (2%)

Renal: Dysuria (2%)

Respiratory: Cough (2%)

<1%, postmarketing, and/or case reports: Abdominal distention, acute renal failure, alopecia, anaphylactoid reactions, angina, arthralgia, bleeding (spontaneous in patients with hemophilia A or B), cerebrovascular disorder, cholesterol increased, crystalluria, depression, dry skin, erythema multiforme, fat redistribution, hemolytic anemia, hepatic failure, hepatitis, hydronephrosis, hyperpigmentation, immune reconstitution syndrome, interstitial nephritis (with medullary calcification and cortical atrophy), leukocyturia (severe and asymptomatic), MI, new-onset diabetes, pancreatitis, paresthesia (oral), paronychia, pharyngitis, pyelonephritis, renal insufficiency, renal failure, Stevens-Johnson syndrome, triglycerides increased, upper respiratory infection, urticaria, vasculitis

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (strong)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Atovaquone: May decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Didanosine: May decrease the serum concentration of Indinavir. Management: Indinavir should be administered on an empty stomach at least 1 hour apart from administration of buffer-containing formulations of didanosine. *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Protease Inhibitors may decrease the serum concentration of Etravirine. This effect is anticipated with darunavir & saquinavir (with low-dose ritonavir). Etravirine may increase the serum concentration of Protease Inhibitors. This effect is anticipated with nelfinavir. Protease Inhibitors may increase the serum concentration of Etravirine. This is expected with lopinavir/ritonavir. Management: Low-dose ritonavir boosting MUST be used when these protease inhibitors are used with etravirine. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

H2-Antagonists: May decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C:*

Monitor therapy

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Venlafaxine: May decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Indinavir bioavailability may be decreased if taken with food. Meals high in calories, fat, and protein result in a significant decrease in drug levels. Indinavir serum concentrations may be decreased by grapefruit juice.

Herb/Nutraceutical: Garlic may decrease the levels/effects of protease inhibitors. St John's wort *(Hypericum)* appears to induce CYP3A enzymes and has lead to 57% reductions in indinavir AUCs and 81% reductions in trough serum concentrations, which may lead to treatment failures; should not be used concurrently with indinavir.

Monitoring ParametersMonitor viral load, CD4 count, triglycerides, cholesterol, glucose, liver function tests, CBC, urinalysis (severe leukocyturia should be monitored frequently).

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase or decrease levels/effects of drugs and increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess therapeutic response (CD4 count, hepatic function) and adverse reactions (eg, gastrointestinal disturbance [nausea, vomiting, diarrhea] that can lead to dehydration and weight loss; hyperlipidemia and redistribution of body fat; rash; CNS effects [malaise, insomnia, abnormal thinking]; electrolyte imbalance) at regular intervals during therapy. Caution patients to monitor glucose levels closely; protease inhibitors may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (eg, glucose testing; use of barrier contraceptives; protease inhibitors may decrease effectiveness of oral contraceptives), and adverse symptoms to report.

Monitoring: Lab TestsMonitor viral load, CD4 count, triglycerides, cholesterol, glucose, liver function tests, CBC, urinalysis (severe leukocyturia should be monitored frequently).

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescriptions, over-the-counter medications, or herbal products (even if they are not on the list) without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Take as directed with meals. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. This medication will be prescribed with a combination of other medications; time these medications as directed by prescriber. You may be advised to check your glucose levels; this class of drug can cause hyperglycemia. Frequent blood tests may be required with prolonged therapy. You may be susceptible to infection; avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug); headache, dizziness, or fatigue (use caution when driving or engaged in potentially hazardous tasks until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); back pain, or arthralgia (consult prescriber for approved analgesic). Inform prescriber if you experience muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; unusual skin rash; change in color of stool or urine; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Effectiveness of oral contraceptives may be decreased, use of alternative (nonhormonal) forms of contraception is recommended; consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Crixivan®: 100 mg, 200 mg, 333 mg, 400 mg

Generic AvailableNo

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Capsules (Crixivan)

200 mg (360): $475.09

400 mg (90): $240.00

Mechanism of ActionIndinavir is a human immunodeficiency virus protease inhibitor, binding to the protease activity site and inhibiting the activity of this enzyme. HIV protease is an enzyme required for the cleavage of viral polyprotein precursors into individual functional proteins found in infectious HIV. Inhibition prevents cleavage of these polyproteins resulting in the formation of immature noninfectious viral particles.

Pharmacodynamics/Kinetics

Absorption: Administration with a high fat, high calorie diet resulted in a reduction in AUC and in maximum serum concentration (77% and 84% respectively); lighter meal resulted in little or no change in these parameters.

Protein binding, plasma: 60%

Metabolism: Hepatic via CYP3A4; seven metabolites of indinavir identified

Bioavailability: Good

Half-life elimination: 1.8 ± 0.4 hour; hepatic insufficiency: 2.8 ± 0.5 hour

Time to peak: 0.8 ± 0.3 hour

Excretion: Feces (83%; 19% as unchanged drug); urine (19%; 9% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia; may rarely cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentContraindicated with midazolam and triazolam; use caution with other benzodiazepines; may produce additive sedation and respiratory depression. Concomitant use of indinavir and St John's wort is not recommended. Coadministration of protease inhibitors (indinavir) with St John's wort is expected to substantially decrease protease inhibitor serum concentrations leading to a loss of virologic response and possible resistance to indinavir or to the class of protease inhibitors.

Index TermsIndinavir Sulfate

Indocyanine Green

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(in doe SYE a neen green)
U.S. Brand NamesIC-Green™
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsDetermining hepatic function, cardiac output, and liver blood flow; ophthalmic angiography
Dosing: Adults

Ophthalmic angiography: Use doses of up to 40 mg of dye in 2 mL of aqueous solvent, in some patients, half the volume (1 mL) has been found to produce angiograms of comparable resolution; immediately following the bolus dose of dye, a bolus of sodium chloride 0.9% 5 mL is given; this regimen will deliver a spatially limited dye bolus of optimal concentration to the choroidal vasculature following I.V. injection into the antecubital vein.

Cardiac output determination: Dye is injected as rapidly as possible through a cardiac catheter; the usual dose is 1.25 mg for infants, 2.5 mg for children, and 5 mg for adults; total dose should not exceed 2 mg/kg; the dye should be flushed from the catheter with sodium chloride 0.9% to prevent hemolysis

Hepatic function studies: 0.5 mg/kg injected as rapidly as possible into the lumen of an arm vein; patient should be in a fasting basal state

Dosing: ElderlyRefer to adult dosing.
Administration: I.V. DetailpH: 6.5
StorageStore at room temperature of 15°C to 25°C (59°F to 77˚F). Use within 6 hours of dilution. Discard if precipitate is present.
ReconstitutionReconstitute only with aqueous solvent supplied by manufacturer.
ContraindicationsHypersensitivity to indocyanine green, iodides, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Immediate treatment for anaphylactic reactions should be available.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been done.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Central nervous system: Headache

Dermatologic: Pruritus, urticaria

Gastrointestinal: Feces discoloration (green)

Miscellaneous: Diaphoresis, anaphylactoid reactions

Drug InteractionsThere are no known significant interactions.
Test InteractionsDo not perform radioactive iodine tests for at least 1 week following indocyanine green administration. Heparin solutions containing sodium bisulfate should not be used as an anticoagulant when collecting blood samples for analysis (reduces absorption peak).
Reference RangeNormal percentage disappearance rate is 18% to 24% per minute
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 25 mg

IC-Green™: 25 mg [contains sodium iodide ≤5%]

Generic AvailableYes
Pharmacodynamics/Kinetics

Protein binding: 95% to albumin

Half-life elimination: 2.5-3 minutes

Excretion: Bile

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Indomethacin

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Indocin® may be confused with Imodium®, Lincocin®, Minocin®, Vicodin®

International issues:

Flexin® [Great Britain] may be confused with Floxin® which is a brand name for ofloxacin in the U.S.

Flexin® [Great Britain]: Brand name for orphenadrine in Israel

Pronunciation(in doe METH a sin)

U.S. Brand NamesIndocin®; Indocin® I.V.

Canadian Brand NamesApo-Indomethacin®; Indo-Lemmon; Indocid® P.D.A.; Indocin®; Indotec; Novo-Methacin; Nu-Indo; Rhodacine®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral; Nonsteroidal Anti-inflammatory Drug (NSAID), Parenteral

Use: Labeled IndicationsAcute gouty arthritis, acute bursitis/tendonitis, moderate to severe osteoarthritis, rheumatoid arthritis, ankylosing spondylitis; I.V. form used as alternative to surgery for closure of patent ductus arteriosus in neonates

Dosing: Adults

Inflammatory/rheumatoid disorders (use lowest effective dose): Oral: 25-50 mg/dose 2-3 times/day; maximum dose: 200 mg/day; extended release capsule should be given on a 1-2 times/day schedule (maximum dose for extended release: 150 mg/day). In patients with arthritis and persistent night pain and/or morning stiffness, may give the larger portion (up to 100 mg) of the total daily dose at bedtime.

Bursitis/tendonitis: Oral: Initial dose: 75-150 mg/day in 3-4 divided doses **or** 1-2 divided doses for extended release; usual treatment is 7-14 days

Acute gouty arthritis: Oral: 50 mg 3 times daily until pain is tolerable then reduce dose; usual treatment <3-5 days

Dosing: ElderlyRefer to adult dosing. Use lowest recommended dose and frequency in elderly to initiate therapy for indications listed in adult dosing.

Dosing: Pediatric

Patent ductus arteriosus:

Neonates: I.V.: Initial: 0.2 mg/kg, followed by 2 doses depending on postnatal age (PNA):

PNA at time of FIRST dose <48 hours: 0.1 mg/kg at 12- to 24-hour intervals

PNA at time of FIRST dose 2-7 days: 0.2 mg/kg at 12- to 24-hour intervals

PNA at time of FIRST dose >7 days: 0.25 mg/kg at 12- to 24-hour intervals

Note: In general, may use 12-hour dosing interval if urine output >1 mL/kg/hour after prior dose; use 24-hour dosing interval if urine output is <1 mL/kg/hour but >0.6 mL/kg/hour; doses should be withheld if patient has oliguria (urine output <0.6 mL/kg/hour) or anuria

Inflammatory/rheumatoid disorders: Children ≥2 years: Oral: 1-2 mg/kg/day in 2-4 divided doses; maximum dose: 4 mg/kg/day; not to exceed 150-200 mg/day

Dosing: Renal ImpairmentNot recommended with advanced renal disease.

Administration: I.V.Administer over 20-30 minutes. Reconstitute I.V. formulation just prior to administration; discard any unused portion; avoid I.V. bolus administration or infusion via an umbilical catheter into vessels near the superior mesenteric artery as these may cause vasoconstriction and can compromise blood flow to the intestines. Do not administer intra-arterially.

Administration: I.V. DetailpH: 6.0-7.5

Administration: OralAdminister with food, milk, or antacids to decrease GI adverse effects. Extended release capsules must be swallowed whole; do not crush.

Dietary ConsiderationsMay cause GI upset; take with food or milk to minimize

StorageI.V.: Store below 30°C (86°F). Protect from light.

ReconstitutionReconstitute with 1-2 mL preservative free NS or SWFI just prior to administration. Discard any unused portion. Do not use preservative-containing diluents for reconstitution.

CompatibilityStable in NS.

Y-site administration: Compatible: Furosemide, insulin (regular), potassium chloride, sodium bicarbonate, sodium nitroprusside. **Incompatible:** Amino acid injection, calcium gluconate, cimetidine, dobutamine, dopamine, gentamicin, levofloxacin, tobramycin, tolazoline. **Variable (consult detailed reference):** Dextrose injection.

Restrictions An FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications Hypersensitivity to indomethacin, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery; patients with a history of proctitis or recent rectal bleeding (suppositories)

Neonates: Necrotizing enterocolitis; impaired renal function; active bleeding (including intracranial hemorrhage and gastrointestinal bleeding), thrombocytopenia, coagulation defects; untreated infection; congenital heart disease where patent ductus arteriosus is necessary

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See“Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.
- Visual disturbances: Prolonged use may cause corneal deposits and retinal disturbances; discontinue if visual changes are observed.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.
- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.
- Depression: Use caution with depression; use may aggravate depression or other psychiatric disorders.
- Epilepsy: Use caution with epilepsy; use may aggravate this condition.
- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.
- Parkinsonism: Use caution with Parkinson’s disease; use may aggravate this condition.
- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.
- Pediatrics: Oral: Safety and efficacy have not been established in children <14 years of age. Hepatotoxicity has been reported in younger children treated for JRA. Closely monitor if needed in children ≥2 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but the elderly may demonstrate these adverse effects at lower doses than younger adults. Indomethacin frequently causes confusion at recommended doses in the elderly.

Pregnancy Risk FactorC/D (3rd trimester)

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Adverse Reactions

>10%: Central nervous system: Headache (12%)

1% to 10%:

Central nervous system: Dizziness (3% to 9%), fatigue (<3%), vertigo (<3%), depression (<3%), malaise (<3%), somnolence (<3%)

Gastrointestinal: Nausea (3% to 9%), epigastric pain (3% to 9%), abdominal pain/cramps/distress (<3%), heartburn (3% to 9%), indigestion (3% to 9%), constipation (<3%), diarrhea (<3%), dyspepsia (3% to 9%), rectal irritation (suppository), tenesmus (suppository), vomiting

Otic: Tinnitus (<3%)

<1%: Acute respiratory distress, agranulocytosis, allergic reactions, allergic rhinitis, anaphylaxis, anemia, angiitis, angioedema, anorexia, anxiety, aplastic anemia, arrhythmia, aseptic meningitis, asthma, bloating, BUN increased, blurred vision, bone marrow suppression, breast enlargement, breast tenderness, bronchospasm, chest pain, cholestatic jaundice, coma, confusion, CHF, conjunctivitis, corneal opacities, cystitis, deafness, depersonalization, depression, diplopia, disseminated intravascular coagulation (DIC), drowsiness, dry eyes, dysarthria, dyspnea, ecchymosis, edema, epistaxis, erythema multiforme, erythema nodosum, exfoliative dermatitis, fatigue, fever, flatulence, fluid retention, flushing, hair loss, gastric perforation (rare), gastritis, GI bleeding, GI ulceration, glucosuria, gynecomastia, hearing decreased, hematuria, hemolytic anemia, hepatitis (including fatal cases), hot flashes, hyperglycemia, hyperkalemia, hypersensitivity reactions, hyper-/hypotension, insomnia, interstitial nephritis, intestinal strictures, itching, involuntary muscle movements, leukopenia, lightheadedness, necrotizing fasciitis, nephrotic syndrome, nervousness, oliguria, palpitation, paresthesia, parkinson’s exacerbation, peptic ulcer, peripheral neuropathy, petechiae, polydipsia, polyuria, proctitis, proteinuria, pruritus, psychic disturbances, psychosis, pulmonary edema, purpura, rash, rectal bleeding, renal insufficiency, renal failure, retinal/macular disturbances, seizure exacerbation, shock, somnolence, Stevens-Johnson syndrome, stomatitis, sweating, syncope, tachycardia, thrombocytopenia, thrombocytopenic purpura, thrombophlebitis, toxic amblyopia, toxic epidermal necrolysis, ulcerative stomatitis, urinary frequency, urticaria, vaginal bleeding, weakness, weight gain

Metabolism/Transport Effects**Substrate** (minor) of CYP2C9, 2C19; **Inhibits** CYP2C9 (strong), 2C19 (weak)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Indomethacin may increase the bioavailability of Tiludronate. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Triamterene: Indomethacin may enhance the nephrotoxic effect of Triamterene. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Food may decrease the rate but not the extent of absorption. Indomethacin peak serum levels may be delayed if taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsFalse-negative dexamethasone suppression test

Monitoring ParametersMonitor response (pain, range of motion, grip strength, mobility, ADL function), inflammation; observe for weight gain, edema; monitor renal function (serum creatinine, BUN); observe for bleeding, bruising; evaluate gastrointestinal effects (abdominal pain, bleeding, dyspepsia); mental confusion, disorientation, CBC, liver function tests (particularly with pediatric use); ophthalmologic exams with prolonged therapy

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness (according to rationale for use), and adverse response when beginning therapy and at regular intervals during treatment. Teach patient proper use, side effects/appropriate interventions (regular ophthalmic evaluations with long-term use), and adverse symptoms to report.

Monitoring: Lab TestsRenal function (serum creatinine and BUN), CBC, liver function (particularly with pediatric use)

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use exactly as directed; do not increase dose without consulting prescriber. Do not crush, break, or chew capsules. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks that require alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help): fluid retention (weigh yourself weekly and report unusual weight gain >3-5 lb/week); or may turn urine green (normal). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping or blood in stool occurs. Report difficult breathing or unusual cough; chest pain, rapid heartbeat, or palpitations; unusual bruising or bleeding; blood in urine, gums, or vomitus; swollen extremities; skin rash, irritation, or itching; acute persistent fatigue; or vision changes or ringing in ears. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 25 mg, 50 mg

Capsule, extended release, oral: 75 mg

Injection, powder for reconstitution:

Indocin® I.V: 1 mg

Suppository, rectal: 50 mg (30s)

Suspension, oral:

Indocin®: 25 mg/5 mL (237 mL) [contains alcohol 1%; pineapple-coconut-mint flavor]

Generic AvailableYes: Excludes injection, oral suspension

Pricing: U.S. (www.drugstore.com)

Capsule, controlled release (Indomethacin CR)

75 mg (30): $82.15

Capsules (Indomethacin)

25 mg (30): $14.99

50 mg (30): $12.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: ~30 minutes

Duration: 4-6 hours

Absorption: Oral: Immediate release: Prompt and extensive; Extended release: 90% over 12 hours

Distribution: V_d: 0.34-1.57 L/kg; crosses blood brain barrier and placenta; enters breast milk

Protein binding: 99%

Metabolism: Hepatic; significant enterohepatic recirculation

Bioavailability: 100%

Half-life elimination: 4.5 hours; prolonged in neonates

Time to peak: Oral: Immediate release: 2 hours

Excretion: Urine (60%, primarily as glucuronide conjugates); feces (33%, primarily as metabolites)

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause sedation, confusion, depression, and hallucinations

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A recent meta-analysis (see References) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other Considerations The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Index Terms Indometacin; Indomethacin Sodium Trihydrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Tumor Necrosis Factor: Alpha Blockers Associated with Unrecognized Invasive Fungal Infections - September 4, 2008

The U.S. Food and Drug Administration (FDA) is alerting healthcare professionals of an increased risk for opportunistic fungal infections in patients treated with antitumor necrosis factor (anti-TNF) agents adalimumab (Humira®), certolizumab pegol (Cimzia®), etanercept (Enbrel®), and infliximab (Remicade®). The FDA has received reports of pulmonary and disseminated cases of histoplasmosis, coccidioidomycosis, blastomycosis, and other fungal infections associated with use of these agents. In some cases, the symptoms of fungal infection (eg, fever, cough, malaise, dyspnea, fatigue) were unrecognized and precluded prompt antifungal treatment, resulting in 12 deaths. In response, the FDA is requiring manufacturers of these agents to strengthen the boxed warning statement in the labeling to further emphasize the risk of invasive fungal infection. Patients should be monitored closely for signs and symptoms suggestive of fungal infection, evidence of which should result in prompt discontinuation of the medication and appropriate diagnostic evaluation. Symptomatic patients should be questioned about their residence in or travel from areas of endemic mycoses, which should prompt consideration of empiric antifungal therapy.

Additional information can be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF2

Tumor Necrosis Factor (TNF) Blockers and Malignancy Risk - June 5, 2008

The U.S. Food and Drug Administration (FDA) issued an Early Communication to healthcare professionals regarding a possible association between TNF blocker (adalimumab, certolizumb pegol, etanercept, and infliximab) use and the development of malignancies in children and young adults. Over the last 10 years, the FDA has received ~30 reports of cancer in children or young adults who had been treated with TNF blockers prior to the age of 18 years. TNF blockers were given for the treatment of Juvenile Idiopathic Arthritis (JIA [formerly termed Juvenile Rheumatoid Arthritis]), Crohn's disease, or other indications in combination with other immunosuppressive medications (eg, azathioprine, 6-mercaptopurine or methotrexate). Approximately half of the reported cancers were lymphomas (Hodgkin's and non-Hodgkin's), which are cancers involving the cells of the immune system.

TNF blockers work by suppressing the immune system. The prescribing information for each TNF blocker contains warnings regarding the possible association of malignancy development with use. Malignancies may not be detected in short-term studies; long-term studies are necessary to identify the impact of TNF blocker therapy on malignancy development. The manufacturers of the four TNF blockers available in the U.S. are being asked by the FDA to provide information regarding all cases of cancer reported in children taking TNF blockers. The FDA is expected to report its findings in approximately 6 months, after completing a safety review and evaluation.

Additional information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF

Medication Safety Issues

Sound-alike/look-alike issues:

Remicade® may be confused with Renacidin®, Rituxan®

InFLIXimab may be confused with riTUXimab

Pronunciation(in FLIKS e mab)

U.S. Brand NamesRemicade®

Canadian Brand NamesRemicade®

Pharmacologic CategoryAntirheumatic, Disease Modifying; Gastrointestinal Agent, Miscellaneous; Monoclonal Antibody; Tumor Necrosis Factor (TNF) Blocking Agent

Use: Labeled IndicationsTreatment of rheumatoid arthritis (moderate-to-severe, with methotrexate); treatment of Crohn's disease (moderate-to-severe with inadequate response to conventional therapy) for induction and maintenance of remission, and/or to reduce the number of draining enterocutaneous and rectovaginal fistulas, and to maintain fistula closure; treatment of psoriatic arthritis; treatment of plaque psoriasis (chronic severe); treatment of ankylosing spondylitis; treatment of and maintenance of healing of ulcerative colitis (moderately- to severely-active with inadequate response to conventional therapy)

Use: Unlabeled/InvestigationalAcute graft-versus-host disease (GVHD), juvenile rheumatoid arthritis (JRA)

Dosing: Adults**Note:** Premedication with antihistamines (anti-H_1 and/or anti-H_2), acetaminophen and/or corticosteroids may be considered to prevent and/or manage infusion-related reactions.

Crohn's disease: I.V.:

Induction regimen: 5 mg/kg at 0, 2, and 6 weeks, followed by 5 mg/kg every 8 weeks; dose may be increased to 10 mg/kg in patients who respond but then lose their response. If no response by week 14, consider discontinuing therapy.

Psoriatic arthritis (with or without methotrexate): 5 mg/kg at 0,2, and 6 weeks, then every 8 weeks

Rheumatoid arthritis: I.V. (in combination with methotrexate therapy): 3 mg/kg at 0, 2, and 6 weeks then every 8 weeks thereafter; doses have ranged from 3-10 mg/kg intravenous infusion repeated at 4- to 8-week intervals

Ankylosing spondylitis: I.V.: 5 mg/kg at 0, 2, and 6 weeks, followed by 5 mg/kg every 6 weeks thereafter

Plaque psoriasis: I.V.: 5 mg/kg at 0, 2, and 6 weeks, then every 8 weeks thereafter

Ulcerative colitis: I.V.: 5 mg/kg at 0, 2, and 6 weeks, followed by 5 mg/kg every 8 weeks thereafter

Acute GVHD (unlabeled use): 10 mg/kg weekly for up to 8 weeks (median 4 weeks of treatment)

Dosage adjustment with CHF: Weigh risk versus benefits for individual patient:

NYHA Class III or IV: ≤5 mg/kg

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Premedication with antihistamines (anti-H_1 and/or anti-H_2), acetaminophen and/or corticosteroids may be considered to prevent and/or manage infusion-related reactions.

Crohn's disease: Children: U.S. labeling ≥6 years, Canadian labeling ≥9 years: 5 mg/kg at 0, 2, and 6 weeks, followed by a maintenance dose of 5 mg/kg every 8 weeks; if no response by week 14, consider discontinuing therapy

Juvenile rheumatoid arthritis (unlabeled use): 3-4 mg/kg at 0, 2, and 6 weeks, and then every 8 weeks thereafter

Dosing: Renal ImpairmentNo adjustment is recommended.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: I.V.Infuse over at least 2 hours; do not infuse with other agents; use in-line low protein binding filter (≤1.2 micron). Temporarily discontinue or decrease infusion rate with infusion-related reactions. Antihistamines (anti-H_1 and/or anti-H_2), acetaminophen and/or corticosteroids may be used to manage reactions. Infusion may be reinitiated at a lower rate upon resolution of mild-to-moderate symptoms.

Canadian labeling (not approved in U.S. labeling): Infusion of doses ≤6 mg/kg over not less than 1 hour may be considered in patients treated for rheumatoid arthritis who have initially tolerated 3 infusions each over 2 hours. Safety of shortened infusion has not been studied with doses >6 mg/kg.

Guidelines for the treatment and prophylaxis of infusion reactions: (**Note:** Limited to dosages used in Crohn's; prospective information on other indications/dosing such as in GVHD are not available).

Treatment of infusion reactions: Medications for the treatment of hypersensitivity reactions should be available for immediate use. A protocol for the treatment of acute infusion reactions, as well a prophylactic therapy for repeat infusions, has been published (Cheifetz, 2003). Decreasing the rate of infusion to 10 mL/hour (for mild-to-moderate reactions) or a 20-minute interruption of the infusion (moderate to severe reactions) is recommended. Monitor vital signs every 10 minutes until normal. Administration of appropriate symptomatic treatment (acetaminophen and diphenhydramine, as well as hydrocortisone and epinephrine for severe reactions) should be instituted (consult institutional policies, if available). Following initial treatment, the infusion may be reinstituted at 10 mL/hour; then increased at 15-minute intervals, as tolerated (first to 20 mL/hour, then 40 mL/hour, then 80 mL/hour to completion).

Prophylaxis of infusion reactions: Premedication with acetaminophen and diphenhydramine 90 minutes prior to infusion may be considered in all patients with prior infusion reactions, and in patients with severe reactions corticosteroid administration is recommended (Cheifetz, 2003). Steroid dosing may be oral (prednisone 50 mg orally for 3 doses over a 24-hour period prior to infusion) or intravenous (a single dose of hydrocortisone 100 mg or methylprednisolone 20-240 mg administered 20 minutes prior to the infusion) (Cheifetz, 2003). On initiation of the infusion, a test dose (infusion at 10 mL/hour for 15 minutes may be considered. If tolerated, for patients with mild reactions, the infusion may be completed over 3 hours. For patients with prior moderate-to-severe reactions, the infusion may be increased at 15-minute intervals, as tolerated, to completion (first to 20 mL/hour, then 40 mL/hour, then 100 mL/hour, and finally 125 mL/hour to completion). A maximum rate of 100 mL/hour is recommended in patients who experienced prior severe reactions. In patients with cutaneous flushing, aspirin may be considered (Becker, 2004).

Administration: I.V. DetailDo not infuse with other agents. Use in-line low protein binding filter (≤ 1.2 micron).

pH ~7.2

StorageStore vials at 2°C to 8°C (36°F to 46°F); do not freeze.

ReconstitutionReconstitute vials with 10 mL sterile water for injection. Swirl vial gently to dissolve powder; do not shake. Allow solution to stand for 5 minutes. Total dose of reconstituted product should be further diluted to 250 mL of 0.9% sodium chloride injection to a final concentration of 0.4-4 mg/mL. Infusion of dose should begin within 3 hours of preparation.

CompatibilityDo not infuse with other agents.

RestrictionsAn FDA-approved medication guide is available at www.fda.gov/cder/Offices/ODS/labeling.htm; distribute to each patient to whom this medication is dispensed.

ContraindicationsHypersensitivity to infliximab, murine proteins or any component of the formulation; doses >5 mg/kg in patients with moderate or severe congestive heart failure (NYHA Class III/IV)

Canadian labeling: Additional contraindications (not in U.S. labeling): Severe infections (eg, sepsis, abscesses, tuberculosis, and opportunistic infections)

Allergy Considerations

- InFLIXimab Allergy

Warnings/Precautions

Boxed warnings:

- Fatal infections: See “Concerns related to adverse effects” below.
- Malignancy: See “Concerns related to adverse effects” below.
- Tuberculosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Autoimmune disorder: Positive antinuclear antibody titers have been detected in patients (with negative baselines). Rare cases of autoimmune disorder, including lupus-like syndrome, have been reported; monitor and discontinue if symptoms develop.
- Fatal infections: **[U.S. Boxed Warning]: Serious and potentially fatal infections (including sepsis, pneumonia, and invasive fungal and other opportunist infections) have been reported in patients receiving TNF-blocking agents.** Cases of unrecognized invasive fungal infections (eg, histoplasmosis, blastomycosis, coccidioidomycosis) have also been reported with anti-TNF agent use. Many of the serious infections in patients treated have occurred in patients on concomitant immunosuppressive therapy. Other opportunistic infections (eg, listeriosis, *Pneumocystis*) have occurred during therapy. Caution should be exercised when considering the use in patients with a history of new/recurrent infections, with conditions that predispose them to infections (eg, diabetes or residence/travel from areas of endemic mycoses), or with chronic, latent, or localized infections. Do not give with clinically important active infection. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued.
- Hepatic reactions: Severe hepatic reactions (including hepatitis, jaundice, acute hepatic failure, and cholestasis) have have been reported during treatment; discontinue with jaundice or marked increase in liver enzymes (≥5 times ULN).
- Hepatitis B: Rare reactivation of hepatitis B virus (HBV) has occurred in chronic virus carriers. Use with caution; evaluate prior to initiation and during treatment.
- Hypersensitivity reactions: Acute infusion reactions may occur. Hypersensitivity reaction may occur within 2 hours of infusion. Medication and equipment for management should be available for immediate use. Interruptions and/or reinstitution at a slower rate may be required (consult protocols). Pretreatment may be considered, and may be warranted in all patients with prior infusion reactions. Serum sickness-like reactions have occurred; may be associated with a decreased response to treatment.
- Malignancy: **[U.S. Boxed Warning]: Hepatosplenic T-cell lymphoma has been reported (rarely) in adolescent and young adults with Crohn’s disease treated with infliximab and azathioprine or 6-mercaptopurine.** The impact of infliximab on the development and course of malignancies is not fully defined, but may be dose dependent. As compared to the general population, an increased risk of lymphoma has been noted in clinical trials; however, rheumatoid arthritis alone has been previously associated with an increased rate of lymphoma. Use caution in patients with a history of COPD, higher rates of malignancy were reported in COPD patients treated with infliximab. Psoriasis patients with a history of phototherapy had a higher incidence of nonmelanoma skin cancers.
- Tuberculosis: **[U.S. Boxed Warning]: Reactivation of latent infections have been associated with infliximab therapy.** Tuberculosis (disseminated or extrapulmonary) has been reactivated in patients previously exposed to TB while on therapy. Most cases have been reported within the first 3-6 months of treatment. Patients should be evaluated for latent tuberculosis infection with a tuberculin skin test prior to starting therapy. Treatment of latent tuberculosis should be initiated before therapy is used. The risk/benefit ratio should be weighed in patients who have resided in regions where histoplasmosis is endemic.

Disease-related concerns:

- Demyelinating CNS disease: Use with caution in patients with pre-existing or recent onset CNS demyelinating disorders; rare cases of optic neuritis and demyelinating disease have been reported; consider discontinuation of therapy if patient develops significant CNS reactions.
- Heart failure (HF): Use with caution in patients with mild HF (NYHA Class I, II) or decreased left ventricular function; worsening and new-onset HF has been reported; doses >5 mg/kg should not be administered in patients with moderate-to-severe heart failure; discontinue therapy with onset of new or worsening symptoms.
- Hematologic disorders: Use with caution in patients with history of hematologic abnormalities; hematologic toxicities (eg, leukopenia, neutropenia, thrombocytopenia, pancytopenia) have been reported. Patients must be advised to seek medical attention if they develop signs and symptoms suggestive of blood dyscrasias; discontinue if significant hematologic abnormalities are confirmed.
- Seizure disorders: Use with caution in patients with a history of seizures; discontinue if significant CNS adverse reactions develop.

Concurrent drug therapy issues:

- Anakinra: Serious infections were reported when anakinra was used with another TNF-blocking agent (etanercept); therefore, concurrent use of infliximab and anakinra is not recommended.

Special populations:

- Pediatrics: Safety and efficacy for use in juvenile rheumatoid arthritis, pediatric plaque psoriasis, or pediatric ulcerative colitis have not been established in children. **Note:** For use in Crohn’s disease: Safety and efficacy have not been established in children <6 years of age (U.S. labeling); safety and efficacy have not been established in children <9 years of age (Canadian labeling).

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. Live vaccines should not be given concurrently; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsReproduction studies have not been conducted. Use during pregnancy only if clearly needed. A Rheumatoid Arthritis and Pregnancy Registry has been established for women exposed to infliximab during pregnancy (Organization of Teratology Information Services, 877-311-8972).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether infliximab is secreted in human milk. Because many immunoglobulins are secreted in milk and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions**Although profile is similar, frequency of adverse effects may vary with disease state. Except where noted, percentages reported in adults with rheumatoid arthritis:**

>10%:

Central nervous system: Headache (18%)

Gastrointestinal: Nausea (21%), diarrhea (12%), abdominal pain (12%, Crohn’s 26%)

Hepatic: ALT increased (risk increased with concomitant methotrexate)

Respiratory: Upper respiratory tract infection (32%), sinusitis (14%), cough (12%), pharyngitis (12%)

Miscellaneous: Development of antinuclear antibodies (~50%), infection (36%), development of antibodies to double-stranded DNA (17%), infusion reactions (20%; severe <1%); Crohn's patients with fistulizing disease: Development of new abscess (15%)

5% to 10%:

Cardiovascular: Hypertension (7%)

Central nervous system: Fatigue (9%), pain (8%), fever (7%)

Dermatologic: Rash (1% to 10%), pruritus (7%)

Gastrointestinal: Dyspepsia (10%)

Genitourinary: Urinary tract infection (8%)

Neuromuscular & skeletal: Arthralgia (1% to 8%), back pain (8%)

Respiratory: Bronchitis (10%), rhinitis (8%), dyspnea (6%)

Miscellaneous: Moniliasis (5%)

<5%: Abscess, adult respiratory distress syndrome, allergic reaction, anemia, arrhythmia, basal cell carcinoma, biliary pain, bradycardia, brain infarction, breast cancer, cardiac arrest, cellulitis, cholecystitis, cholelithiasis, circulatory failure, confusion, constipation, dehydration, delayed hypersensitivity (plaque psoriasis), diaphoresis increased, dizziness, edema, gastrointestinal hemorrhage, heart failure, hemolytic anemia, hepatitis, hypersensitivity reactions, hypotension, ileus, intervertebral disk herniation, intestinal obstruction, intestinal perforation, intestinal stenosis, leukopenia, lupus-like syndrome, lymphadenopathy, lymphoma, malignancies, meningitis, menstrual irregularity, MI, myalgia, neuritis, pancreatitis, pancytopenia, peripheral neuropathy, peritonitis, pleural effusion, pleurisy, proctalgia, pulmonary edema, pulmonary embolism, renal calculus, renal failure, respiratory insufficiency, seizure, sepsis, serum sickness, suicide attempt, syncope, tachycardia, tendon disorder, thrombocytopenia, thrombophlebitis (deep), ulceration

The following adverse events were reported in children with Crohn’s disease and were found more frequently in children than adults:

>10%:

Hepatic: Liver enzymes increased (18%; ≥5 times ULN: 1%)

Hematologic: Anemia (11%)

Miscellaneous: Infections (56%; more common with every 8-week versus every 12-week infusions)

1% to 10%:

Central nervous system: Flushing (9%)

Gastrointestinal: Blood in stool (10%)

Hematologic: Leukopenia (9%), neutropenia (7%)

Neuromuscular & skeletal: Bone fracture (7%)

Respiratory: Respiratory tract allergic reaction (6%)

Miscellaneous: Viral infection (8%), bacterial infection (6%), antibodies to infliximab (3%)

Postmarketing and/or case reports (adults or children): Agranulocytosis, anaphylactic reactions, anaphylactic shock, angina, angioedema, autoimmune hepatitis, bronchospasm, cholestasis, demyelinating disorders (eg, multiple sclerosis, optic neuritis); drug-induced lupus-like syndrome, erythema multiforme, Guillain-Barré syndrome, heart failure (worsening), hepatitis B reactivation, hepatocellular damage, hepatosplenic T-cell lymphoma (HSTCL), Hodgkin's disease, idiopathic thrombocytopenia purpura, interstitial fibrosis, interstitial pneumonitis, jaundice, laryngeal/pharyngeal edema, latent tuberculosis reactivation, liver failure, liver function tests increased, neuropathy, numbness, opportunistic infection, pericardial effusion, pneumonia, psoriasis, seizure, Stevens-Johnson syndrome, thrombotic thrombocytopenia purpura, taste abnormal, tingling, toxic epidermal necrolysis, transverse myelitis, tuberculosis, urticaria, vasculitis (systemic and cutaneous)

Drug Interactions

Abatacept: Anti-TNF Agents may enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Anakinra: Anti-TNF Agents may enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Rilonacept: Anti-TNF Agents may enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid echinacea (may diminish the therapeutic effect of infliximab).

Monitoring ParametersDuring infusion, if reaction is noted, monitor vital signs every 10 minutes until normal. Follow-up monitoring includes monitoring for improvement of symptoms; signs of infection; LFTs (discontinue if >5 times ULN); place and read PPD before initiation. Psoriasis patients with history of phototherapy should be monitored for nonmelanoma skin cancer.

Nursing: Physical Assessment/MonitoringMonitor therapeutic effectiveness and adverse reactions. Place and read PPD before initiation of therapy. Treatment of latent TB infection should be initiated prior to treatment with infliximab. Monitor for signs or symptoms of infection. Assess for signs of liver dysfunction (eg, unusual fatigue, easy bruising or bleeding, jaundice). Teach patient appropriate interventions to reduce side effects and adverse symptoms to report.

Patient EducationThis drug can only be administered by infusion. Avoid receiving immunizations unless approved by prescriber. You will be more prone to infection. Avoid crowds and wash your hands frequently. Report headache or unusual fatigue; increased nausea or abdominal pain; bruising or bleeding easily; cough, runny nose, respiratory difficulty; chest pain or persistent dizziness; fatigue, muscle pain or weakness, back pain; fever or chills; mouth sores; vaginal itching or discharge; sore throat; unhealed sores; or frequent infections. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Remicade®: 100 mg [contains sucrose 500 mg and polysorbate 80]

Generic AvailableNo

ManufacturerCentocor, Inc

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Remicade)

100 mg (1): $646.61

Mechanism of ActionInfliximab is a chimeric monoclonal antibody that binds to human tumor necrosis factor alpha (TNFα), thereby interfering with endogenous TNFα activity. Biological activities of TNFα include the induction of proinflammatory cytokines (interleukins), enhancement of leukocyte migration, activation of neutrophils and eosinophils, and the induction of acute phase reactants and tissue degrading enzymes. Animal models have shown TNFα expression causes polyarthritis, and infliximab can prevent disease as well as allow diseased joints to heal.

Pharmacodynamics/Kinetics

Onset of action: Crohn's disease: ~2 weeks

Distribution: V_d: 3-6 L

Half-life elimination: 7-12 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsInfliximab, Recombinant; NSC-728729

Influenza Virus Vaccine (H5N1)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Influenza virus vaccine (H5N1) may be confused with the nonavian strain of influenza virus vaccine

Pronunciation(in floo EN za VYE rus vak SEEN H5N1)

Pharmacologic CategoryVaccine

Use: Labeled IndicationsActive immunization of adults at increased risk of exposure to the H5N1 viral subtype of influenza

Dosing: AdultsImmunization: Adults 18-64 years: I.M.: 1 mL, followed by second 1 mL dose given 28 days later (acceptable range: 21-35 days)

Administration: I.M.For I.M. administration only. Inspect for particulate matter and discoloration prior to administration. Vaccinate in the deltoid muscle using a ≥1 inch needle length. Suspension should be shaken well prior to use. **Note:** For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

StorageStore between 2°C to 8°C (36°F to 46°F). Potency is destroyed by freezing; do not use if product has been frozen. Protect from light.

RestrictionsCommercial distribution is not planned. The vaccine will be included as part of the U.S. Strategic National Stockpile. It will be distributed by public health officials if needed.

ContraindicationsManufacturer states no contraindications

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

- Hypersensitivity: Small quantities of egg protein may be present; may cause severe reactions in patients with egg allergies. Administration to patients with known hypersensitivity to previous influenza virus vaccination, or any component of the formulation, should be carefully weighed against the risk of not vaccinating.

Disease-related concerns:

- Guillain-Barré (GBS): Use with caution in patients with a history of GBS; these patients may have a greater likelihood of developing GBS. Relationship to this influenza vaccine formulation is not known; in patients with recent GBS (≤6 weeks), decision to administer vaccine should entail careful consideration of risk:benefit.

Special populations:

- Elderly: Safety and efficacy have not been established in adults >64 years of age.

- Immunosuppressed patients: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids]); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Formulation components: Vaccine contains thimerosal, chicken protein, and egg protein.

Geriatric ConsiderationsNo clinical studies in elderly have been done to date. Differences in immune response may be different than the titer response seen in younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Vaccine should be given only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Headache (3% to 36%), malaise (22%)

Local: Pain (74%), tenderness (70%), erythema/redness (20%), induration/swelling (15%)

Neuromuscular & skeletal: Myalgia (16%)

1% to 10%:

Central nervous system: Fever (up to 7%)

Gastrointestinal: Nausea (10%), diarrhea (6%)

Respiratory: Nasopharyngitis (2%), upper respiratory infection (2%), nasal congestion (1%)

Additional reactions observed with other influenza vaccine formulations: Allergic reaction, anaphylaxis, angioedema, asthma, encephalopathy, facial paralysis, hives, GBS, neuropathy, optic neuritis, vasculitis

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringCarefully evaluate patient for contraindications and prior immunization history for possible adverse events. Treatment for anaphylactic/anaphylactoid reaction should be immediately available during vaccine use. See specific administration directions. **Note:** All serious adverse reactions must be reported to the U.S. DHHS. Date of administration, name of manufacturer, lot number, and administering person's name, title, and address should be recorded in patient's permanent medical record. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient Education

Notify prescriber immediately of any acute reaction to vaccination (eg, difficulty breathing, chest pain, acute headache, rash, difficulty swallowing). May cause mild headache, fever, muscle pain, or some redness, pain, or swelling at injection site; consult prescriber if excessive or persisting. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsInjection, suspension [monovalent]: Hemagglutinin (H5N1 strain) 90 mcg/1 mL (5 mL) [contains thimerosal, and chicken, porcine, and egg proteins]

Generic AvailableNo

Mechanism of ActionA monovalent, split virus (inactivated) preparation of the H5N1 avian strain of influenza virus (A/Vietnam/1203/2004) which promotes active immunity to avian influenza.

Pharmacodynamics/KineticsOnset of action: Four-fold increase in antibody titers occurred in up to 58% of patients 28 days after second dose.

Related Information

- Immunization Recommendations
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

The 2-dose regimen prompted antibody response consistent with a protective titer in up to 58% of patients. However, there are no clinical data evaluating whether vaccination protects patients against development of infection. Therefore, protection against a pandemic avian flu strain cannot be assured.

Healthcare workers involved in the care of patients with known or suspected H5N1 viral subtype influenza infection should be vaccinated with the most recent seasonal human influenza vaccine in order to reduce the risk of co-infection of human influenza A viruses.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMalaise is common

Mental Health: Effects on Psychiatric TreatmentNone reported

Influenza Virus Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Fluarix® may be confused with Flarex®

Influenza virus vaccine may be confused with tetanus toxoid and tuberculin products. Medication errors have occurred when tuberculin skin tests (PPD) have been inadvertently administered instead of tetanus toxoid products and influenza virus vaccine. These products are refrigerated and often stored in close proximity to each other.

Influenza virus vaccine (human strain) may be confused with the avian strain (H5N1) of influenza virus vaccine

International issues:

Hiberix is also a brand name for *Haemophilus* b conjugate vaccine in Slovenia

Pronunciation(in floo EN za VYE rus vak SEEN)

U.S. Brand NamesAfluria®; Fluarix®; FluLaval™; FluMist®; Fluvirin®; Fluzone®

Canadian Brand NamesFluviral S/F®; Vaxigrip®

Pharmacologic CategoryVaccine, Inactivated (Viral); Vaccine, Live (Viral)

Use: Labeled IndicationsProvide active immunity to influenza virus strains contained in the vaccine

Advisory Committee on Immunization Practices (ACIP) recommends annual vaccination for all children (6 months to 18 years) and adults. Target groups for vaccination (those at higher risk of complications from influenza infection and their close contacts) include the following:

- Persons ≥50 years of age
- Residents of nursing homes and other chronic-care facilities that house persons of any age with chronic medical conditions
- Adults and children with chronic disorders of the pulmonary or cardiovascular systems (except hypertension), including asthma
- Adults and children who have chronic metabolic diseases (including diabetes mellitus), hepatic disease, renal dysfunction, hematologic disorders, hemoglobinopathies, or immunosuppression (including immunosuppression caused by medications or HIV)
- Adults and children with conditions which may compromise respiratory function, the handling of respiratory secretions, or that can increase the risk of aspiration (eg, cognitive dysfunction, spinal; cord injuries, seizure disorders, other neuromuscular disorders)
- Children and adolescents (6 months to 18 years of age) who are receiving long-term aspirin therapy and therefore, may be at risk for developing Reye's syndrome after influenza
- Women who will be pregnant during the influenza season
- Children 6-59 months of age
- Healthcare personnel
- Household contacts and caregivers of children <5 years (particularly children <6 months) and adults ≥50 years
- Household contacts and caregivers of persons with medical conditions which put them at high risk of complications from influenza infection

Dosing: AdultsOptimal time to receive vaccine is October-November, prior to exposure to influenza; however, vaccination should continue into December and throughout the influenza season as long as vaccine is available.

Immunization:

Afluria®, Fluarix®, FluLaval™: I.M.: 0.5 mL/dose (1 dose per season)

Fluzone®, Fluvirin®: I.M.: 0.5 mL/dose (1 dose per season)

FluMist®: Intranasal: Adults ≤49 years: 0.2 mL/dose (1 dose per season)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricOptimal time to receive vaccine is October-November, prior to exposure to influenza; however, vaccination should continue into December and throughout the influenza season as long as vaccine is available.

Note: Children <9 years who are not previously vaccinated or who received only 1 dose of vaccine during the previous season should receive 2 doses, in order to achieve satisfactory antibody response. Although products are licensed for use in specific ages, if a particular vaccine is inadvertently administered to a child in a nonapproved age group, it does not need to be repeated.

Immunization:

Fluzone®: I.M.:

Children 6-35 months: 0.25 mL/dose (1 or 2 doses per season; see **Note**)

Children 3-8 years: 0.5 mL/dose (1 or 2 doses per season; see **Note**)

Children ≥9 years: Refer to adult dosing.

Fluvirin®: I.M.:

Children 4-8 years: 0.5 mL/dose (1 or 2 doses per season; see **Note**)

Children ≥9 years: Refer to adult dosing.

FluMist®: Intranasal:

Children 2-8 years, previously **not vaccinated** with influenza vaccine: Initial season: Two 0.2 mL doses separated by at least 4 weeks

Children 2-8 years, previously **vaccinated** with influenza vaccine: 0.2 mL/dose (1 or 2 doses separated by at least 4 weeks; see **Note**)

Children ≥9 years: Refer to adult dosing.

Administration: I.M.TIV: For I.M. administration only. Inspect for particulate matter and discoloration prior to administration. Adults and older children should be vaccinated in the deltoid muscle using a ≥1 inch needle length. Infants and young children <12 months of age should be vaccinated in the anterolateral aspect of the thigh using a $^{7}/_{8}$ inch to 1 inch needle length. Young children with adequate deltoid muscle mass should be vaccinated using a $^{7}/_{8}$ inch to 1.25 inch needle. Suspensions should be shaken well prior to use.

Note: For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends "it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

Administration with other vaccines:

Influenza virus vaccine (inactivated; TIV) with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Influenza virus vaccine (inactivated; TIV) with live vaccines: May be given simultaneously or at any interval between doses

Influenza virus vaccine (live; LAIV) with other live vaccines:

Intranasal or injectable: If not given simultaneously, wait at least 4 weeks between administration

Oral: May be given simultaneously or at any interval between doses of live or inactivated injectable vaccines

Vaccine administration with antibody-containing products*:

Antibody-containing products and influenza virus vaccine (inactivated; TIV): May be given simultaneously at different sites or at any interval between doses

Antibody-containing products and influenza virus vaccine (live; LAIV): Influenza virus vaccine (live; LAIV) may be given at any time before, after or simultaneously with an antibody-containing product.

*Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

Administration: OtherLAIV: Intranasal: Half the dose (0.1 mL) is administered to each nostril; patient should be in upright position. A dose divider clip is provided. Severely-immunocompromised persons should not administer the live vaccine. If recipient sneezes following administration, the dose should not be repeated. Also refer to Administration I.M. for use with other vaccines.

Storage

Injection: Store between 2°C to 8°C (36°F to 46°F). Potency is destroyed by freezing; do not use if product has been frozen.

Afluria®, FluLaval™: Discard 28 days after initial entry. Protect from light.

Fluarix®: Protect from light.

Fluzone®: Between uses, the multiple dose vial should be stored at 2°C to 8°C (36°F to 46°F).

Nasal spray: Store in refrigerator at 2°C to 8°C (36°F to 46°F). **Do not freeze.**

ContraindicationsHypersensitivity to influenza virus vaccine, or any component of the formulation; presence of acute respiratory disease or other active infections or febrile illnesses; active neurological disorder (immunization should be delayed)

In addition, for nasal spray: Children 2-17 years of age receiving aspirin therapy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Guillain-Barré syndrome: Use with caution in patients with history of Guillain-Barré syndrome (GBS); patients with history of GBS have a greater likelihood of developing GBS than those without. May consider avoiding vaccination in patients with a history of GBS and who are at low risk for severe influenza complications, and in patients known to have experienced GBS within 6 weeks following previous vaccination (consider influenza antiviral chemoprophylaxis in these patients).

- HIV: Antigenic response may not be as great as expected in HIV-infected persons with CD4 cells <100/mm^3 and with viral copies of HIV type 1 >30,000/mL.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Safety and efficacy of the nasal spray have not been established in adults ≥50 years of age.

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. Data on the use of the nasal spray in immunocompromised patients is limited.

- Pediatrics: Safety and efficacy of the injection have not been established in children <6 months of age. Safety and efficacy of the nasal spray have not been established in children <2 years of age.

Dosage form specific issues:

- Arginine: Some products are manufactured using arginine.

- Chicken egg protein: Some products are manufactured with chicken egg protein.

- Gelatin: Some products are manufactured using gelatin

- Gentamicin: Some products are manufactured with gentamicin.

- Injection (inactivated, split virus, TIV): Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration. May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever). Inactivated vaccine is preferred over live virus vaccine for household members, healthcare workers and others coming in close contact with severely-immunosuppressed persons requiring care in a protected environment.

- Latex: Packaging may contain natural latex rubber.

- Nasal spray (live, attenuated virus; LAIV): For intranasal use only. **Avoid contact with severely immunocompromised individuals for at least 7 days following vaccination.** Use the nasal spray with caution in patients with asthma or children <5 years of age with recurrent wheezing; risk of wheezing following vaccination is increased. Patients with severe asthma or active wheezing were not included in clinical trials and use in these patients is not recommended. Children <24 months of age had increased wheezing and hospitalizations following administration in clinical trials; use of the nasal spray is not approved in this age group. Defer immunization if nasal congestion is present which may impede delivery of vaccine. Because safety and efficacy information is limited, the ACIP does not recommend the use of LAIV in patients with the following conditions: chronic metabolic diseases (including diabetes mellitus), hepatic disease, renal dysfunction, hematologic disorders, hemoglobinopathies, history of GBS, immunosuppression, chronic disorders of the pulmonary or cardiovascular systems (including asthma), pregnant women, or children and adolescents receiving long-term aspirin therapy

- Neomycin: Some products are manufactured with neomycin.

- Polymyxin: Some products are manufactured with polymyxin.

- Thimerosal: Some products contain thimerosal; hypersensitivity reactions may occur.

Other warnings/precautions:

- Previous season vaccines: Influenza vaccines from previous seasons must not be used.

Geriatric ConsiderationsLimited data on the elderly exists due to ethical considerations precluding use of placebo and differences in studies and vaccines; 80% develop a 1:40 HA titer, 70% are completely protected, 90% protected from death.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Case reports and limited studies suggest pregnancy may increase the risk of serious medical complications from influenza infection. Vaccination is recommended regardless of stage of pregnancy. Vaccination with the injection during the third trimester of pregnancy has been shown to decrease the incidence of laboratory confirmed influenza and respiratory illness with fever in infants ≤6 months. The safety and efficacy of the nasal spray have not been studied in pregnant pregnant women; however, pregnant women do not need to avoid contact with persons recently vaccinated with LAIV.

Breast-Feeding ConsiderationsUse of influenza vaccine has not been shown to affect the safety of breast-feeding mothers or their infants. The use of the nasal spray (live virus vaccine) should be used with caution (per manufacturer) due to the possibility of viral shedding from mother to infant. The ACIP recommends use of either TIV or LAIV in breast-feeding women unless contraindicated due to other medical conditions.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Injection:

Frequency not defined.

Cardiovascular: Chest tightness, facial edema

Central nervous system: Chills, fatigue, fever, headache, irritability, insomnia, and malaise (may start within 6-12 hours and last 1-2 days; incidence equal to placebo in adults; occurs more frequently than placebo in children); Guillain-Barré syndrome (GBS)

Dermatologic: Angioedema, bruising, rash, urticaria

Gastrointestinal: Sore throat

Local: Tenderness, redness, sweling, or induration at the site of injection (10% to 64%; may last up to 2 days); injection site pain

Neuromuscular & skeletal: Arthralgia, myalgia (may start within 6-12 hours and last 1-2 days; incidence equal to placebo in adults; occurs more frequently than placebo in children)

Ocular: Red eyes

Respiratory: Cough, nasopharyngitis

Miscellaneous: Allergic or anaphylactoid reactions (most likely to residual egg protein; includes allergic asthma, angioedema, hives, systemic anaphylaxis)

Postmarketing and/or case reports: Angioneurotic edema, arthritis, brachial neuritis, bronchospasm, cellulites, conjunctivitis, diaphoresis, dizziness, dysphagia, dysphonia, dyspnea, encephalopathy, eye pain, facial palsy (Bell’s palsy), flushing, Henoch-Schönlein purpura, hypoesthesia, hypokinesia, limb paralysis, microscopic polyangiitis (vasculitis), paresthesia, laryngitis, lymphadenopathy, neuralgia, neuropathy, optic neuritis, pallor, pharyngitis, photophobia, periorbital edema, pruritus, rhinitis, seizure (rare; majority associated with fever), serum sickness, somnolence, Stevens-Johnson syndrome, syncope, tachycardia, throat tightness, transient thrombocytopenia, transverse myelitis, tremor, vasodilation, vasculitis (with transient renal involvement), vertigo, vomiting, weakness

Nasal spray: Frequency of events reported within 10 days

>10%:

Central nervous system: Headache (children 3% to 9%; adults 40%), irritability (children 12% to 21%), lethargy (children 6% to 14%)

Gastrointestinal: Appetite decreased (children 13% to 21%)

Neuromuscular & skeletal: Tiredness/weakness (adults 26%), muscle aches (children 2% to 6%; adults 17%)

Respiratory: Cough (adults 14%), nasal congestion/ runny nose (children 51% to 58%; adults 9% to 44%), sore throat (children 5% to 11%; adults 28%)

1% to 10%:

Central nervous system: Chills (children 2% to 4%, adults 9%), fever (100°F to 101°F: children 6% to 9%; >101°F: children 1% to 4%)

Gastrointestinal: Abdominal pain (children 2% to 12%)

Otic: Otitis media (children 3%)

Respiratory: Sinusitis (adults 4%), sneezing (children 2%), wheezing (children 6-23 months 6%; children 24-59 months 2%)

Postmarketing and/or case reports: Anaphylactic reactions, asthma exacerbations, Bell's palsy, diarrhea, epistaxis, facial edema, Guillain-Barré syndrome, hypersensitivity reaction, mitochondrial encephalomyopathy (Leigh syndrome) exacerbation, nausea, rash, urticaria, vomiting

Drug Interactions

Antiviral Agents (Influenza A and B): May diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringEvaluate patient’s prior immunization history, allergy to eggs, and appropriateness for vaccination prior to therapy. See administration directions according to formulation. **Note:** All serious adverse reactions must be reported to the U.S. DHHS. Date of administration, name of manufacturer, lot number, and administering person’s name, title, and address should be recorded in patient’s permanent medical record. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationNotify prescriber immediately of any acute reaction to vaccination (eg, difficulty breathing or swallowing, chest pain, palpitations, acute headache, rash, seizures, high fever). Follow directions for care of injection site. May cause mild headache, chills, fever, or muscle pain; if these persist beyond 1-2 days or become severe, consult prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [purified split-virus]:

Afluria®: 5 mL [TIV; contains chicken egg protein, thimerosal, neomycin (trace amounts), and polymyxin (trace amounts)]

FluLaval™: 5 mL [TIV; contains chicken egg protein and thimerosal]

Fluvirin®: 5 mL [TIV; contains chicken egg protein, thimerosal, neomycin (trace amounts), and polymyxin (trace amounts)]

Fluzone®: 5 mL [TIV; contains chicken egg protein and thimerosal]

Injection, suspension [purified split-virus; preservative free]:

Afluria®: 0.5 mL [TIV; contains chicken egg protein, neomycin (trace amounts), and polymyxin (trace amounts)]

Fluarix®: 0.5 mL [TIV; contains chicken egg protein, gentamicin (trace amounts), natural rubber/natural latex in packaging, polysorbate 80, and thimerosal (trace amounts)]

Fluvirin®: 0.5 mL [TIV; contains chicken egg protein, thimerosal (trace amounts), neomycin (trace amounts), and polymyxin (trace amounts)]

Fluzone®: 0.25 mL, 0.5 mL [TIV; contains chicken egg protein]

Solution, intranasal [preservative free; spray]:

FluMist®: 0.2 mL [trivalent, LAIV; contains arginine, chicken egg protein, gelatin, and gentamicin]

Generic AvailableNo

Mechanism of ActionPromotes immunity to influenza virus by inducing specific antibody production. Each year the formulation is standardized according to the U.S. Public Health Service. Preparations from previous seasons must not be used.

Pharmacodynamics/Kinetics

Onset of action: Protective antibody titers achieved ~2 weeks after vaccination

Duration: Protective antibody titers persist approximately ≥6 months. Elderly: Protective antibody titers may fall ≤4 months after vaccination.

Related Information

- Immunization Recommendations
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsPharmacies will stock the formulations(s) standardized according to the USPHS requirements for the season. Influenza vaccines from previous seasons must not be used. Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

The optimal time to receive vaccine is October-November, prior to exposure to influenza; however, vaccination should continue into December and later as long as vaccine is available. To avoid missed opportunities for vaccination, patients at risk for complications can be offered the vaccine during routine healthcare visits as early as September if vaccine is available. Avoid vaccination before October in older persons in nursing homes or similar housing facilities because antibody levels can decline more rapidly following vaccination. When vaccine is available, children aged 6 months to <9 years of age who have not been previously vaccinated, should receive their first dose in September so that both doses can be administered prior to the onset of influenza activity.

When vaccine supply is not limited, either TIV or LAIV can be used in healthy, nonpregnant persons aged 2-49 years of age.

When vaccine supply is limited, administration should focus on the ACIP target groups. When TIV vaccine is in short supply, administering LAIV to eligible persons is encouraged to increase available TIV to those patients in whom LAIV cannot be used. During periods of inactivated influenza vaccine (TIV) shortage, the CDC and ACIP have recommended vaccination be prioritized based on the following three tiers. The grouping is based on influenza associated mortality and hospitalization rates. Those listed in group 1 should be vaccinated first, followed by persons in group 2, and then group 3. If the vaccine supply is extremely limited, group 1 has also been subdivided in three tiers, where those in group 1A should be vaccinated first, followed by 1B, then 1C.

Priority groups for vaccination with inactivated influenza vaccine during periods of vaccine shortage:

Tier 1A:

Persons ≥65 years with comorbid conditions

Residents of long-term-care facilities

Tier 1B:

Persons 2-64 years with comorbid conditions

Persons ≥65 years without comorbid conditions

Children 6-23 months

        - Pregnant women

    - Tier 1C:

        - Healthcare personnel

        - Household contacts and out-of-home caregivers of children <6 months

    - Tier 2:

        - Household contacts of children and adults at increased risk of influenza associated complications

        - Healthy persons 50-64 years

    - Tier 3:

        - Persons 2-49 years without high-risk conditions

Medication Safety Issues

Sound-alike/look-alike issues:

NovoLog® Mix 70/30 may be confused with Novolin® 70/30

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin AS part PROE ta meen & IN soo lin AS part)

U.S. Brand NamesNovoLog® Mix 70/30

Canadian Brand NamesNovoMix® 30

Pharmacologic CategoryInsulin, Combination

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control

Dosing: AdultsRefer to Insulin Regular. Fixed ratio insulins (such as insulin aspart protamine and insulin aspart combination) are normally administered in 2 daily doses.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism.

Administration: OtherAspart protamine human suspension and aspart human solution (NovoLog® Mix 70/30): SubQ administration only. Cold injections should be avoided. Should be administered within 15 minutes before a meal. Normally administered twice daily (before breakfast and supper). SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. Resuspend immediately prior to use. Gently roll vial or pen in the palms of the hands to resuspend before using. Do not mix or dilute with other insulins.

StorageNovoLog® Mix 70/30: Store unopened container in refrigerator. Do not use if frozen. If refrigeration is not possible, vial (in use) may be stored at room temperature for up to 28 days. The pen in use should **not** be refrigerated, store below 30°C (86°F) away from direct heat or light; discard after 14 days. If refrigeration is not available, opened vials may be stored unrefrigerated in cool place away from heat and sunlight.

CompatibilityDo not mix or dilute with other insulins.

ContraindicationsHypersensitivity to any component of the formulation; during episodes of hypoglycemia

Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effects of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage or even death. Insulin requirements may be altered during illness, emotional disturbances or other stresses.

- Hypokalemia: Insulin causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Special populations:

- Pediatrics: Safety and efficacy of this insulin product have not been established in children.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient’s impaired glycemic control. Treatment and monitoring regimens must be individualized.

- I.V. administration: Regular insulin is the only insulin to be used intravenously. Insulin aspart may also be administered I.V. in selected clinical situations to control hyperglycemia; close medical supervision is required.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsHow “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination; see Insulin Aspart monograph

LactationSee Insulin Aspart monograph.

Breast-Feeding ConsiderationsSee Insulin Aspart monograph.

Pregnancy & Lactation, In-Depth

- Insulin Aspart in Pregnancy & Lactation

Adverse ReactionsRefer to Insulin Regular.

Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Insulin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Beta-Blockers: May enhance the hypoglycemic effect of Insulin. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Edetate CALCIUM Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Edetate Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Insulin may enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/Monitoring

See individual agent for Insulin Aspart.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension:

NovoLog® Mix 70/30: Insulin aspart protamine suspension 70% [intermediate acting] and insulin aspart solution 30% [rapid acting]: 100 units/mL (3 mL) [FlexPen® prefilled syringe]; (10 mL) [vial]

Generic AvailableNo

Suspension (NovoLOG Mix 70/30 FlexPen)

70-30% (15): $192.42

Mechanism of ActionRefer to Insulin Regular. Insulin aspart protamine and insulin aspart is a combination insulin product with intermediate-acting characteristics. Normally administered twice daily.

Pharmacodynamics/Kinetics**Note:** Rate of absorption, onset, and duration of activity may be affected by site of injection, exercise, presence of lipodystrophy, local blood supply, and/or temperature.

Onset of action: 0.2 hours

Peak effect: 1-4 hours

Duration: 18-24 hours

Half-life: 8-9 hours

Time to peak, plasma: 1-1.5 hours

Excretion: Urine

Medication Safety Issues

Sound-alike/look-alike issues:

NovoLog® may be confused with Novolin®

NovoLog® Mix 70/30 may be confused with NovoLog®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin AS part)

U.S. Brand NamesNovoLog®

Canadian Brand NamesNovoRapid®

Pharmacologic CategoryInsulin, Rapid-Acting

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control

Dosing: AdultsRefer to Insulin Regular. Insulin aspart is a rapid-acting insulin analog which is normally administered as a premeal component of the insulin regimen. It is normally used along with a long-acting (basal) form of insulin or continuous basal administration of insulin via a SubQ infusion pump.

I.V.: Insulin aspart may be administered I.V. in selected clinical situations to control hyperglycemia. Appropriate medical supervision is required.

SubQ: When used in a meal-related treatment regimen, 50% to 70% of total daily insulin requirement may be provided by insulin aspart as divided premeal boluses and the remainder provided by an intermediate or long-acting insulin or continuous basal administration of insulin via a SubQ infusion pump. Due to rapid onset and short duration, some patients may require more basal insulin to prevent premeal hyperglycemia when using insulin aspart as opposed to regular insulin.

SubQ infusion pump: Initial programming of the pump may be based upon the total daily dose of insulin (TDD) given in the previous regimen with ~50% of the TDD given as divided premeal boluses and ~50% of TDD given as a basal infusion; adjust dose as necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing. Also refer to Insulin Regular.

Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism. Close monitoring of blood glucose and adjustment of therapy is required in renal impairment.

Dosing: Hepatic ImpairmentInsulin requirements may be reduced. Close monitoring of blood glucose and adjustment of therapy is required in hepatic impairment.

Administration: I.V.Do not use if solution is viscous or cloudy; use only if clear and colorless. Insulin aspart may be administered I.V. in selected clinical situations to control hyperglycemia. Appropriate medical supervision is required. **Do not administer insulin mixtures intravenously.**

Administration: I.V. DetailBecause of adsorption, the actual amount of insulin aspart being administered via I.V. infusion could be substantially less than the apparent amount. Therefore, adjustment of the insulin aspart I.V. infusion rate should be based on effect and not solely on the apparent insulin aspart dose. The apparent dose may be used as a starting point for determining the subsequent SubQ dosing regimen (Schmeltz, 2006); however, frequent monitoring of blood glucose and adjustment of therapy is required. Infusion requires continuous medical supervision.

Administration: OtherDo not use if solution is viscous or cloudy; use only if clear and colorless.

SubQ: Should be administered immediately before a meal (within 5-10 minutes of the start of a meal). Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. If mixed with human NPH insulin, insulin aspart should be drawn into syringe first. Can be infused SubQ by external insulin pump; however, when used in an external pump, should not be diluted with other insulins. **Do not administer insulin mixtures intravenously.**

SubQ infusion pump: When used in an external SubQ infusion pump, insulin aspart should not be diluted or mixed with other insulins. The reservoir, infusion sets, and infusion set insertion site must be changed at least every 48 hours.

Dietary ConsiderationsDietary modification based on ADA recommendations is a key component of therapy.

StorageInsulin aspart (NovoLog®): Store unopened vials, cartridges, and syringes in refrigerator between 2°C and 8°C (36°F to 46°F); do not use if frozen. If stored at room temperature of <30°C (<86°F), use within 28 days and protect from heat and light. Once punctured (in use), vials may be stored for up to 28 days at temperatures of <30°C (<86°F); do not freeze. Cartridges that are punctured (in use) should be stored at temperatures <30°C (<86°F) and used within 28 days; do not freeze or refrigerate. For insulin pumps, the insulin aspart in the reservoir should be replaced every 48 hours. Discard if exposed to temperatures ≥37°C (98.6°F).

For SubQ administration: Should be stored at temperatures <30°C (<86°F) and used within 28 days; do not freeze or refrigerate.

For I.V. infusion. Stable for 24 hours at room temperature of <30°C (<86°F).

Reconstitution

For SubQ administration: May be diluted with insulin-diluting medium to a concentration of 10 units/mL (U-10) or 50 units/mL (U-50).

For I.V. infusion; May be diluted in NS, D_5W, or $D_{10}W$ with 40 mEq/L potassium chloride at concentrations from 0.05 units/mL to 1 unit/mL using polypropylene infusion bags.

CompatibilityDo not mix with Lantus®. May mix with human NPH insulin; draw NovoLog® into the syringe first and use immediately after mixing. When used in an external pump, should not be diluted with other insulins.

ContraindicationsHypersensitivity to insulin aspart or any component of the formulation; during episodes of hypoglycemia

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effect of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage, or even death. Insulin requirements may be altered during illness, emotional disturbances, or other stresses.

- Hypokalemia: Insulin (especially I.V. insulin) causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium frequently with I.V. use and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

  Due to short duration of action, a longer acting insulin or continuous basal administration of insulin via a SubQ infusion pump is needed to maintain adequate glucose control in type 1 diabetes mellitus (insulin dependent, IDDM). In type 2 diabetes mellitus (noninsulin dependent, NIDDM), insulin aspart may be used without a long-acting insulin or continuous basal administration of insulin via a SubQ infusion pump when used in combination with a sulfonylurea. Preprandial administration should be immediately followed by a meal within 5-10 minutes. Insulin aspart may be administered I.V. in selected clinical situations to control hyperglycemia.

- I.V. administration: Insulin aspart may be administered I.V. in selected clinical situations to control hyperglycemia; close medical supervision is required.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsHow "tightly" a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have generally not been observed in animal reproduction studies; therefore, the manufacturer classifies insulin aspart as pregnancy category B. When compared to regular insulin, the use of insulin aspart during pregnancy has not been found to increase the risk of adverse events to the fetus. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range.

Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and the mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. Insulin aspart has been demonstrated to be as safe and effective as regular human insulin when used during pregnancy and may have advantages over regular insulin during pregnancy.

LactationExcretion in breast milk unknown/compatible

Breast-Feeding ConsiderationsIt is not known if insulin aspart is found in breast milk. Endogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

Pregnancy & Lactation, In-Depth

- Insulin Aspart in Pregnancy & Lactation

Adverse ReactionsRefer to Insulin Regular.

Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Insulin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Beta-Blockers: May enhance the hypoglycemic effect of Insulin. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Edetate CALCIUM Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Edetate Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Insulin may enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsRefer to Insulin Regular.

Monitoring ParametersSerum glucose, electrolytes, Hb A_{1c}

Reference RangeRefer to Insulin Regular.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypoglycemia) at regular intervals during therapy. Teach patient proper use, including appropriate injection technique and syringe/needle disposal and monitoring requirements (or refer to diabetic educator), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum glucose, electrolytes, Hb A_{1c}

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. It is imperative to follow other components of prescribed treatment (eg, diet and exercise regimen). Take exactly as directed. Do not change dose or discontinue unless advised by prescriber. With insulin aspart (NovoLog®), you must start eating within 5-10 minutes after injection. If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Monitor glucose levels as directed by prescriber. Report adverse side effects, including chest pain or palpitations; persistent fatigue, confusion, headache; skin rash or redness; numbness of mouth, lips, or tongue; muscle weakness or tremors; vision changes; respiratory difficulty; or nausea, vomiting, or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

NovoLog®: 100 units/mL (3 mL) [FlexPen® prefilled syringe or PenFill® prefilled cartridge]; (10 mL) [vial]

Generic AvailableNo

Manufacturer

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Note: Insulin detemir is a clear solution, but it is NOT intended for I.V. or I.M. administration.

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin DE te mir)

U.S. Brand NamesLevemir®

Canadian Brand NamesLevemir®

Pharmacologic CategoryInsulin, Intermediate- to Long-Acting

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control

Dosing: AdultsAlso refer to Insulin Regular.

Note: Duration is dose-dependent. Dosage must be carefully titrated (adjustment of dose and timing. Adjustment of concomitant antidiabetic treatment (short-acting insulins or oral antidiabetic agents) may be required.

Type 1 or type 2 diabetes: Basal insulin or basal-bolus: May be substituted on a unit-per-unit basis. Adjust dose to achieve glycemic targets.

Insulin-naive patients (type 2 diabetes only): 0.1-0.2 units/kg once daily in the evening or 10 units once or twice daily. Adjust dose to achieve glycemic targets. Note: Canadian labeling recommends 10 units once daily (twice daily dosing is not included).

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥ 6 years: Refer to adult dosing. Note: In Canada, insulin detemir is not approved for use in children.

Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism.

Administration: I.M.Not for I.M. administration.

Administration: I.V.Insulin detemir is a clear solution but it is NOT intended for I.V. administration.

Administration: Other Insulin detemir (Levemir®): SubQ administration: Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. Not for infusion pumps. Cannot be diluted or mixed with other insulins.

Once daily: Administer with evening meal or at bedtime.

Twice daily: Administer evening dose with evening meal, at bedtime, or 12 hours following morning dose.

Dietary ConsiderationsDietary modification based on ADA recommendations is a key component of therapy.

StorageInsulin detemir (Levemir®): Store unopened container in refrigerator; do not use if it has been frozen. Once opened (in use), vials may be stored in refrigerator or for up to 42 days at room temperature (below 30°C). Cartridges and prefilled syringes that are in use should be stored at room temperature and used within 42 days; do not refrigerate. Do not store with needle in place. All opened (in-use) vials should be stored away from direct heat and sunlight.

CompatibilityDo not dilute or mix with other insulins.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effects of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage or even death. Insulin requirements may be altered during illness, emotional disturbances or other stresses.

- Hypokalemia: Insulin causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

- Dosage adjustments: Careful adjustment of dosage and timing is required to achieve glycemic targets. Adjustment of other antidiabetic therapy (short-acting or oral antidiabetic agents) may be required. The duration of of action of insulin detemir is dose-dependent and this factor must be considered during dosage adjustment and titration.

- Not intended for I.V. administration: Insulin detemir is a clear solution but it is NOT intended for I.V. or I.M. administration. Regular insulin and/or insulin aspart may be administered I.V. in selected clinical situations to control hyperglycemia; close medical supervision is required.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric Considerations How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk Factor C

Pregnancy Considerations Adverse events were observed in animal reproduction studies; therefore, the manufacturer classifies insulin detemir as pregnancy category C. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and the mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. Pregnant women using insulin detemir should be switched to NPH insulin pending additional safety information with this agent.

Lactation Excretion in breast milk unknown/compatible

Breast-Feeding Considerations It is not known if insulin detemir is found in breast milk. Endogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

Pricing: U.S. (www.drugstore.com)

Solution (Levemir)

100 units/mL (10): $95.30

Solution (Levemir Flexpen)

100 units/mL (15): $181.72

Mechanism of ActionRefer to Insulin Regular. Insulin detemir differs from human insulin by a single amino acid omission (threonine at B30) and the addition of a 14-carbon fatty acid chain attached at the B29 position. On injection, the fatty acid chain facilitates self-association between the molecules as well as binding to albumin. The delayed release of insulin from the injection site and albumin binding sites result in more prolonged action and limits variability in the amount of free insulin at steady-state. Insulin detemir has a duration of action which is dose-dependent. The FDA-approved product labeling identifies this product as a long-acting insulin analog; however, at lower dosages (<0.6 units/kg) published data regarding its duration of action is consistent with an intermediate insulin form (12-20 hours). In clinical trials it has been compared primarily with NPH insulin and dosed in a similar manner. In some patients, or at higher dosages, it may have a duration of action up to 24 hours, which is consistent with a long-acting insulin.

Pharmacodynamics/Kinetics**Note:** Rate of absorption, onset, and duration of activity may be affected by site of injection, exercise, presence of lipodystrophy, local blood supply, and/or temperature.

Onset of action: 3-4 hours

Peak effect: 3-14 hours

Duration: Dose dependent: 6-23 hours; **Note:** Duration is dose-dependent. At lower dosages (0.1-0.2 units/kg), mean duration is variable (5.7-12.1 hours). At 0.6 units/kg, the mean duration was 19.9 hours. At high dosages (>0.6 units/kg) the duration is longer and less variable (mean of 22-23 hours).

Bioavailability: 60%

Half-life: 5-7 hours (dose dependent)

Protein binding: >98% (albumin)

Distribution: V_d: 0.1 L/kg

Time to peak, plasma: 6-8 hours

Excretion: Urine

- Insulin Regular

Pharmacotherapy PearlsThe product labeling identifies this product as a long-acting form of insulin; however, at lower dosages (≤0.6 units/kg) its pharmacodynamic characteristics and dosing are consistent with intermediate insulin forms such as NPH.

Dental Health: Effects on Dental TreatmentPatients with type 1 diabetes (insulin dependent) should be appointed for dental treatment in the morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or confusion

Mental Health: Effects on Psychiatric TreatmentMAO inhibitors may enhance the hypoglycemic effects of insulin; TCAs may antagonize the effects of insulin

Index TermsDetemir Insulin

Medication Safety Issues

Sound-alike/look-alike issues:

Insulin glargine may be confused with insulin glulisine

Lantus® may be confused with Lente®

Lente® may be confused with Lantus®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Pronunciation(IN soo lin GLAR jeen)

U.S. Brand NamesLantus®

Canadian Brand NamesLantus®; Lantus® OptiSet®

Pharmacologic CategoryInsulin, Long-Acting

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) requiring basal (long-acting) insulin to improve glycemic control

Dosing: AdultsSubQ:

Type 1 diabetes: As a basal component of combination insulin regimen, normally 50% to 75% of daily insulin requirement is administered as a long-acting form. More rapid acting forms are usually used in association with meals. Refer to Insulin Regular.

Type 2 diabetes:

Patient not already on insulin: 10 units once daily, adjusted according to patient response (range in clinical study: 2-100 units/day)

Patient already receiving insulin: In clinical studies, when changing to insulin glargine from once-daily NPH or Ultralente® insulin, the initial dose was not changed; when changing from twice-daily NPH to once-daily insulin glargine, the total daily dose was reduced by 20% and adjusted according to patient response

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Type 1 or type 2 diabetes:** Children ≥6 years: Refer to adult dosing.

Dosing: Renal ImpairmentInsulin requirements may be reduced due to changes in insulin clearance or metabolism.

Dosing: Hepatic ImpairmentInsulin requirements may be reduced due to changes in glucose production and insulin metabolism.

Administration: OtherInsulin glargine (Lantus®): SubQ administration: Should be administered once daily, at any time of day, but should be administered at the same time each day. Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. Cannot be diluted or mixed with any other insulin or solution. Solution should be clear and colorless with no visible particles; inspect solution prior to administration.

StorageInsulin glargine (Lantus®): Store unopened vials, cartridges, and disposable insulin devices in refrigerator; do not use if it has been frozen. If not refrigerated, use within 28 days and protect from heat and light. Once opened (in use), vials may be stored in refrigerator or for up to 28 days at room temperature. Opened cartridge systems (OptiClik®) and disposable insulin devices (SoloStar®) (in use) should be stored at room temperature and used within 28 days; do not refrigerate.

CompatibilityDo not dilute or mix with any other insulin or solution.

ContraindicationsHypersensitivity to insulin glargine or any component of the formulation

Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Hypoglycemia: The most common adverse effect of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage, or even death. Insulin requirements may be altered during illness, emotional disturbances, or other stresses.

• Hypokalemia: Insulin causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient’s impaired glycemic control. Treatment and monitoring regimens must be individualized.

- Not intended for I.V. administration: Insulin glargine is a clear solution, but it is **NOT** intended for I.V. or I.M. administration. Regular insulin and/or insulin aspart may be administered I.V. in selected clinical situations to control hyperglycemia; close medical supervision is required.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been shown in some animal studies; therefore, the manufacturer classifies insulin glargine as pregnancy category C. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when Hb A_{1c} is above the normal range.

Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and the mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. Pregnancy outcome information following the use of insulin glargine is available from case reports and small studies. Current reports indicate that insulin glargine is effective when used during pregnancy and may be an option for pregnant women with significantly uncontrolled diabetes; however, pregnant women using insulin glargine should be switched to NPH insulin pending additional safety information with this agent.

LactationExcretion in breast milk unknown/compatible

Breast-Feeding ConsiderationsIt is not known if significant amounts of insulin glargine are found in breast milk. Endogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

Pregnancy & Lactation, In-Depth

- Insulin Glargine in Pregnancy & Lactation

Adverse ReactionsRefer to Insulin Regular.

Metabolism/Transport EffectsRefer to Insulin Regular.

Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Insulin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Beta-Blockers: May enhance the hypoglycemic effect of Insulin. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Edetate CALCIUM Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Edetate Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Insulin may enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsRefer to Insulin Regular.

Monitoring ParametersUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}

Reference RangeRefer to Insulin Regular.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, hypoglycemia) at regular intervals during therapy. Teach patient proper use, including appropriate injection technique and syringe/needle disposal and monitoring requirements (or refer to diabetic educator), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. It is imperative to follow other components of prescribed treatment (eg, diet and exercise regimen). Take exactly as directed. Do not change dose or discontinue unless advised by prescriber. If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Monitor glucose levels as directed by prescriber. Report adverse side effects, including chest pain or palpitations; persistent fatigue, confusion, headache; skin rash or redness; numbness of mouth, lips, or tongue; muscle weakness or tremors; vision changes; respiratory difficulty; or nausea, vomiting, or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Lantus®: 100 units/mL (3 mL) [OptiClik® prefilled cartridge or SoloStar® disposable insulin device]; (10 mL) [vial]

Solution (Lantus for OptiClik)

100 units/mL (15): $190.75

Solution (Lantus SoloStar)

100 units/mL (15): $187.61

Mechanism of ActionRefer to Insulin Regular. Insulin glargine is a long-acting insulin analog.

Pharmacodynamics/Kinetics**Note:** Rate of absorption, onset, and duration of activity may be affected by site of injection, exercise, presence of lipodystrophy, local blood supply, and/or temperature.

Onset of action: 3-4 hours

Peak effect: No pronounced peak

Duration: Generally 24 hours or longer; reported range: 10.8 to >24 hours (up to 32 hours documented in some studies)

Absorption: Slow; upon injection into the subcutaneous tissue, microprecipitates form which allow small amounts of insulin glargine to release over time

Metabolism: Partially metabolized in the skin to form two active metabolites

Time to peak, plasma: No pronounced peak

Excretion: Urine

Related Information

- Insulin Products
- Insulin Regular

Pharmacotherapy PearlsThe duration of action of insulin glargine is generally 24 hours or longer with a relatively flat action profile throughout this interval. Many pharmacokinetic and pharmacodynamic studies were terminated at 24 hours despite the fact that insulin glargine continued to exhibit hypoglycemic activity beyond 24 hours; therefore, it is difficult to determine the absolute duration of action.

Clinicians should be aware that, in rare cases, patients may exhibit hypoglycemic activity beyond 24 hours and that accumulation of insulin glargine is possible. Adequate monitoring and subsequent dosage adjustments should be made in patients who are requiring less insulin to maintain euglycemia after several days of therapy.

On the other hand, insulin glargine has a reported duration of action that ranges from 10.8 to >24 hours. On rare occasions, patients may require twice-daily injections of insulin glargine to deliver adequate basal insulin coverage over 24 hours. Some clinicians may also switch to twice-daily dosing in patients who require >100 units of insulin glargine per day to allow for complete absorption. Dosing insulin glargine 3 times daily is not recommended.

Dental Health: Effects on Dental TreatmentPatients with type 1 diabetes (insulin dependent) should be appointed for dental treatment in the morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or confusion

Mental Health: Effects on Psychiatric TreatmentMAO inhibitors may enhance the hypoglycemic effects of insulin; TCAs may antagonize the effects of insulin

Medication Safety Issues

Sound-alike/look-alike issues:

Insulin glulisine may be confused with insulin glargine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Pronunciation(IN soo lin gloo LIS een)
U.S. Brand NamesApidra®
Canadian Brand NamesApidra®
Pharmacologic CategoryInsulin, Rapid-Acting
Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control
Dosing: AdultsRefer to Insulin Regular. Insulin glulisine is equipotent to insulin regular, but has a more rapid onset. Insulin glulisine is normally administered as a premeal component of the insulin regimen. It is normally used along with a long-acting (basal) form of insulin or continuous basal administration of insulin via a SubQ infusion pump.

SubQ: When used in a meal-related treatment regimen, 50% to 70% of total daily insulin requirement may be provided by insulin glulisine (in divided doses) and the remainder provided by an intermediate or long-acting insulin. Insulin glulisine may also be administered by external subcutaneous infusion pumps.

I.V.: Under close medical supervision, insulin glulisine may be administered by infusion.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to Insulin Regular. Insulin glulisine is equipotent to insulin regular, but has a more rapid onset.
Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism. Close monitoring of blood glucose and adjustment of therapy is required in renal impairment.
Administration: I.V.

Insulin glulisine may be administered by the I.V. route only in a carefully controlled clinical setting with medical supervision and close monitoring of blood glucose as well as serum potassium.

Administration: I.V. DetailA dedicated infusion line should be used. **Do not administer insulin mixtures intravenously.** The recommended infusion concentration is 0.05-1 unit/mL in NS using PVC bags.
Administration: OtherInsulin glulisine (Apidra®): SubQ administration: Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. Insulin glulisine should be administered within 15 minutes before or within 20 minutes after start of a meal. Can be infused SubQ into the abdominal wall by external insulin pump; however, when used in an external pump, should not be diluted or mixed with other insulins. Rotate infusion site.
StorageInsulin glulisine (Apidra®): Store unopened vials in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Once opened, may store under refrigeration or at room temperature ≤25°C (77°F); use within 28 days. Stable in infusion pump for up to 48 hours. Discard if exposed to temperatures >37°C (98.6°F). Open, in-use cartridges inserted in the Opti-Clik® system should not be refrigerated; keep at room temperature ≤25°C (77°F); use within 28 days.

For I.V. infusion in a controlled clinical setting: Store at room temperature. Stable for 48 hours.

ReconstitutionFor I.V. infusion in a controlled clinical setting: The recommended infusion concentration is 0.05-1 unit/mL in NS using PVC bags.
Compatibility

For SubQ administration by injection (not via pump), insulin glulisine (Apidra®) may be mixed with NPH insulin; Apidra® should be drawn into the syringe first. When used in an external pump, insulin glulisine should not be diluted or mixed with other insulins.

For I.V. infusion, may be mixed with NS.

ContraindicationsHypersensitivity to insulin glulisine or any component of the formulation; during episodes of hypoglycemia
Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effect of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage or even death. Insulin requirements may be altered during illness, emotional disturbances or other stresses.

- Hypokalemia: Insulin (especially I.V. insulin) causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium frequently with I.V. use and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

  Due to short duration of action, a longer acting insulin or continuous basal administration of insulin via a SubQ infusion pump is needed to maintain adequate glucose control in type 1 diabetes mellitus (insulin dependent, IDDM). In type 2 diabetes mellitus (noninsulin dependent, NIDDM), insulin glulisine may be used without a long-acting insulin or continuous basal administration of insulin via a SubQ infusion pump when used in combination with a sulfonylurea. Preprandial administration should be immediately followed by a meal within 5-10 minutes.

- I.V. administration: May be administered by the I.V. route only in a carefully controlled clinical setting with medical supervision and close monitoring of blood glucose as well as serum potassium.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsHow "tightly" a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in some animal reproduction studies; therefore, the manufacturer classifies insulin glulisine as pregnancy category C. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range.

Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. Due to lack of clinical studies with insulin glulisine in pregnant women, the manufacturer recommends use during pregnancy only if the potential benefit to the mother justifies any potential risk to the fetus.

LactationExcretion in breast milk unknown/compatible

Breast-Feeding ConsiderationsIt is not known if insulin glulisine is found in breast milk. Endogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

Monitoring: Lab TestsUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}, lipid profile

Blood glucose and serum potassium should be closely monitored during I.V. infusion.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. It is imperative to follow other components of prescribed treatment (eg, diet and exercise regimen). Take exactly as directed. Do not change dose or discontinue unless advised by prescriber. Insulin glulisine (Apidra®) should be administered within 15 minutes before or within 20 minutes after start of a meal. If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Monitor glucose levels as directed by prescriber. Report adverse side effects, including chest pain or palpitations; persistent fatigue, confusion, headache; skin rash or redness; numbness of mouth, lips, or tongue; muscle weakness or tremors; vision changes; respiratory difficulty; or nausea, vomiting, or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Apidra®: 100 units/mL (3 mL [cartridge], 10 mL [vial])

Generic AvailableNo

ManufacturerSanofi-Aventis Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Apidra)

100 units/mL (10): $101.88

Solution (Apidra OptiClik)

100 units/mL (15): $195.82

Mechanism of ActionRefer to Insulin Regular. Insulin glulisine is a rapid-acting insulin analog. Insulin glulisine differs from human insulin by the replacement of two amino acids on the B-chain (positions B3 and B29).

Pharmacodynamics/Kinetics**Note:** Rate of absorption, onset, and duration of activity may be affected by site of injection, exercise, presence of lipodystrophy, local blood supply, and/or temperature.

Onset of action: 0.2-0.5 hours

Peak effect: 1.6-2.8 hours

Duration: 3-4 hours

Distribution: I.V.: 13 L

Bioavailability: SubQ: ~70%

Half-life

I.V.: 13 minutes

SubQ: 42 minutes

Time to peak, plasma: 0.6-2 hours

Excretion: Urine

Medication Safety Issues

Sound-alike/look-alike issues:

> Humalog® Mix 75/25™ may be confused with Humulin® 70/30.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin LYE sproe PROE ta meen & IN soo lin LYE sproe)
U.S. Brand NamesHumalog® Mix 50/50™; Humalog® Mix 75/25™
Canadian Brand NamesHumalog® Mix 25
Pharmacologic CategoryInsulin, Combination
Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control
Dosing: AdultsRefer to Insulin Regular. Fixed ratio insulins (such as insulin lispro protamine and insulin lispro) are normally administered in 2 daily doses.
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism.
Administration: OtherInsulin lispro protamine and insulin lispro (Humalog® Mix 75/25™): SubQ administration only. Should be administered within 15 minutes before or after a meal. Normally administered twice daily (breakfast and supper). Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. Resuspend immediately prior to use. Gently roll vial or pen in the palms of the hands to resuspend before using. Do not mix or dilute with other insulins.
Dietary ConsiderationsDietary modification based on ADA recommendations is a key component of therapy.
StorageInsulin lispro protamine and insulin lispro (Humalog® Mix): Store unopened container in refrigerator; do not use if it has been frozen. Once opened (in use), vials may be stored in refrigerator or for up to 28 days at room temperature. Pens should be stored at room temperature and used within 10 days. Do not expose to temperatures >37°C (98.6°F).
CompatibilityDo not mix or dilute with other insulins.
ContraindicationsHypersensitivity to any component of the formulation; during episodes of hypoglycemia
Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effects of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage, or even death. Insulin requirements may be altered during illness, emotional disturbances, or other stresses.

- Hypokalemia: Insulin causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Adverse ReactionsRefer to Insulin Regular.

Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Insulin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Beta-Blockers: May enhance the hypoglycemic effect of Insulin. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Edetate CALCIUM Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Edetate Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Insulin may enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Medication Safety Issues

Sound-alike/look-alike issues:

Humalog® may be confused with Humulin®, Humira®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin LYE sproe)

U.S. Brand NamesHumalog®

Canadian Brand NamesHumalog®

Pharmacologic CategoryInsulin, Rapid-Acting

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control

Dosing: AdultsRefer to Insulin Regular. Insulin lispro is equipotent to insulin regular, but has a more rapid onset.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to Insulin Regular. Insulin lispro is equipotent to insulin regular, but has a more rapid onset.

Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism. Close monitoring of blood glucose and adjustment of therapy is required in renal impairment.

Administration: OtherInsulin lispro (Humalog®): SubQ administration: May be administered within 15 minutes before or immediately after a meal. Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. Can be infused SubQ by external insulin pump; however, when used in an external pump, should not be diluted or mixed with other insulins.

Note: May be mixed in the same syringe as Humulin® N or Humulin® U, but Humalog® should be drawn into the syringe first.

Dietary ConsiderationsDietary modification based on ADA recommendations is a key component of therapy.

StorageInsulin lispro (Humalog®): Store unopened container in refrigerator; do not use if it has been frozen. If not refrigerated, use within 28 days and protect from heat and light. Once opened (in use), vials may be stored in refrigerator or for up to 28 days at room temperature. Cartridges/pens should be stored at room temperature and used within 28 days. When used in an external pump, replace insulin in reservoir within 48 hours and cartridges within 7 days; do not expose to temperatures >37°C (98.6°F). If diluted with sterile diluent (available from manufacturer), 1:10 dilutions are stable for 28 days stored at 5°C (41°F) or 14 days stored at 30°C (86°F).

CompatibilityA sterile diluent is available from the manufacturer for preparing dilutions of Humalog®.

Insulin lispro (Humalog®): May be mixed in the same syringe as Humulin® N or Humulin® U, but Humalog® should be drawn into the syringe first. When used in an external pump, should not be diluted or mixed with other insulins.

ContraindicationsHypersensitivity to any component of the formulation

Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effects of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage or even death. Insulin requirements may be altered during illness, emotional disturbances or other stresses.

- Hypokalemia: Insulin (especially I.V. insulin) causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium frequently with I.V. use and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

  Due to short duration of action, a longer acting insulin or continuous basal administration of insulin via a SubQ infusion pump is needed to maintain adequate glucose control in type 1 diabetes mellitus (insulin dependent, IDDM). In type 2 diabetes mellitus (noninsulin dependent, NIDDM), insulin lispro may be used without a long-acting insulin or continuous basal administration of insulin via a SubQ infusion pump when used in combination with a sulfonylurea. Preprandial administration should be immediately followed by a meal within 5-10 minutes.

- I.V. administration: May be administered via I.V. route only in a carefully controlled clinical setting with medical supervision and close monitoring of blood glucose as well as serum potassium.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsHow “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal reproduction studies; therefore, the manufacturer classifies insulin lispro as pregnancy category B. Insulin lispro has not been shown to cross the placenta at standard clinical doses. Although congenital anomalies have been noted in case reports, when compared to regular insulin, insulin lispro has not been found to increase the risk of adverse events to the fetus in larger studies. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when Hb A_{1c} is above the normal range.

Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. The use of insulin lispro has been shown to be as effective as regular insulin to treat diabetes in pregnancy and may have advantages over regular insulin during pregnancy.

LactationExcretion in breast milk unknown/compatible

Breast-Feeding ConsiderationsIt is not known if significant amounts of insulin lispro are found in breast milk. Endogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

- Hypokalemia: Insulin causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy ConsiderationsSee individual agents.

Breast-Feeding ConsiderationsSee individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Humulin® may be confused with Humalog®, Humira®

Novolin® may be confused with NovoLog®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin N P H)

U.S. Brand NamesHumulin® N; Novolin® N

Canadian Brand NamesHumulin® N; Novolin® ge NPH

Pharmacologic CategoryInsulin, Intermediate-Acting

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM) and type 2 diabetes mellitus (noninsulin dependent, NIDDM) to improve glycemic control

Dosing: AdultsRefer to Insulin Regular. Insulin NPH is usually administered 1-2 times daily.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to Insulin Regular. Insulin NPH is usually administered 1-2 times daily.

Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism.

Administration: OtherInsulin NPH (intermediate-acting insulin): SubQ administration: May be administered 1-2 times/day. Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. When mixing regular insulin with other preparations of insulin, regular insulin should be drawn into syringe first. Gently roll vial or pen in the palms of the hands to resuspend before using. Insulin lispro (Humalog®) may be mixed in the same syringe as Humulin® N, but Humalog® should be drawn into the syringe first.

Dietary ConsiderationsDietary modification based on ADA recommendations is a key component of therapy.

StorageInsulin NPH (Humulin® N, Novolin® N): Store unopened container in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze. Vial in use may be stored under refrigeration or at room temperature. Humulin® N Pen in use should not be refrigerated; store below 30°C (86°F) away from direct heat or light. Discard after 2 weeks.

CompatibilityInsulin lispro (Humalog®) may be mixed in the same syringe as Humulin® N, but Humalog® should be drawn into the syringe first. A sterile diluent is available from the manufacturer for preparing dilutions of Humulin® N.

ContraindicationsHypersensitivity to any component of the formulation

Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effects of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage or even death. Insulin requirements may be altered during illness, emotional disturbances or other stresses.

- Hypokalemia: Insulin causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsHow “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy ConsiderationsMaternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and the mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. NPH insulin is preferred over other intermediate-acting insulin products during pregnancy.

LactationExcretion in breast milk unknown/compatible

Breast-Feeding ConsiderationsEndogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

Pregnancy & Lactation, In-Depth

- Insulin NPH in Pregnancy & Lactation

Adverse ReactionsRefer to Insulin Regular.

Metabolism/Transport EffectsRefer to Insulin Regular.

Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Insulin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Beta-Blockers: May enhance the hypoglycemic effect of Insulin. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Edetate CALCIUM Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Edetate Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Insulin may enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsRefer to Insulin Regular.

Monitoring ParametersUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}, lipid profile

Reference RangeRefer to Insulin Regular.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypoglycemia) at regular intervals during therapy. Teach patient proper use, including appropriate injection technique and syringe/needle disposal and monitoring requirements (or refer to diabetic educator), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}, lipid profile

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. It is imperative to follow other components of prescribed treatment (eg, diet and exercise regimen). Take exactly as directed. Do not change dose or discontinue unless advised by prescriber. If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Monitor glucose levels as directed by prescriber. Report adverse side effects, including chest pain or palpitations; persistent fatigue, confusion, headache; skin rash or redness; numbness of mouth, lips, or tongue; muscle weakness or tremors; vision changes; respiratory difficulty; or nausea, vomiting, or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Medication Safety Issues

Sound-alike/look-alike issues:

Humulin® may be confused with Humalog®, Humira®

Novolin® may be confused with NovoLog®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error. ***Due to the number of insulin preparations, it is essential to identify/clarify the type of insulin to be used.***

Concentrated solutions (eg, U-500) should not be available in patient care areas.

Cross-contamination may occur if insulin pens are shared among multiple patients. Steps should be taken to prohibit sharing of insulin pens.

Pronunciation(IN soo lin REG yoo ler)

U.S. Brand NamesHumulin® R; Humulin® R U-500; Novolin® R

Canadian Brand NamesHumulin® R; Novolin® ge Toronto

Pharmacologic CategoryAntidote; Insulin, Short-Acting

Use: Labeled IndicationsTreatment of type 1 diabetes mellitus (insulin dependent, IDDM); type 2 diabetes mellitus (noninsulin dependent, NIDDM) unresponsive to treatment with diet and/or oral hypoglycemics, to improve glycemic control; adjunct to parenteral nutrition; diabetic ketoacidosis (DKA)

Use: Unlabeled/InvestigationalHyperkalemia (regular insulin only; use with glucose to shift potassium into cells to lower serum potassium levels)

Dosing: AdultsSubQ (regular insulin may also be administered I.V.): The number and size of daily doses, time of administration, and diet and exercise require continuous medical supervision. In addition, specific formulations may require distinct administration procedures (see Administration).

Type 1 Diabetes Mellitus:Note: Multiple daily doses guided by blood glucose monitoring are the standard of diabetes care. Combinations of insulin are commonly used.

Initial dose: 0.2-0.6 unit/kg/day in divided doses. Conservative initial doses of 0.2-0.4 units/kg/day are often recommended to avoid the potential for hypoglycemia.

Division of daily insulin requirement: Generally, 50% to 75% of the daily insulin dose is given as an intermediate- or long-acting form of insulin (in 1-2 daily injections). The remaining portion of the 24-hour insulin requirement is divided and administered as a rapid-acting or short-acting form of insulin. These may be given with meals (before or at the time of meals depending on the form of insulin) or at the same time as injections of intermediate forms (some premixed combinations are intended for this purpose).

Adjustment of dose: Dosage must be titrated to achieve glucose control and avoid hypoglycemia. Adjust dose to maintain premeal and bedtime glucose of 80-140 mg/dL (children <5 years: 100-200 mg/dL). Since combinations of agents are frequently used, dosage adjustment must address the individual component of the insulin regimen which most directly influences the blood glucose value in question, based on the known onset and duration of the insulin component. Also see Additional Information or Pharmacotherapy Pearls.

Usual maintenance range: 0.5-1.2 units/kg/day in divided doses. An estimate of anticipated needs may be based on body weight and/or activity factors as follows:

Adolescents: May require ≤1.5 units/kg/day during growth spurts

Nonobese: 0.4-0.6 units/kg/day

Obese: 0.8-1.2 units/kg/day

Renal failure: Due to alterations in pharmacokinetics of insulin, may require <0.2 units/kg/day

Type 2 Diabetes Mellitus:

Augmentation therapy: Dosage must be carefully adjusted.

Insulins other than glargine: Initial dosage of 0.15-0.2 units/kg/day have been recommended

Insulin glargine: Initial dose: 10 units/day

Note: Administered when residual beta-cell function is present, as a supplemental agent when oral hypoglycemics have not achieved goal glucose control. Twice daily NPH, or an evening dose of NPH, lente, or glargine insulin may be added to oral therapy with metformin or a sulfonylurea. Augmentation to control postprandial glucose may be accomplished with regular, glulisine, aspart, or lispro insulin.

Monotherapy: Initial dose: Highly variable: See Augmentation therapy dosing.

Note: An empirically-defined scheme for dosage estimation based on fasting plasma glucose and degree of obesity has been published with recommended doses ranging from 6-77 units/day (Holman, 1995). In the setting of glucose toxicity (loss of beta-cell sensitivity to glucose concentrations), insulin therapy may be used for short-term management to restore sensitivity of beta-cells; in these cases, the dose may need to be rapidly reduced/withdrawn when sensitivity is re-established.

Hyperkalemia (unlabeled use): I.V.: Administer dextrose at 0.5-1 mL/kg and regular insulin 1 unit for every 4-5 g dextrose given

Diabetic ketoacidosis:

I.V.: Regular insulin 0.15 units/kg initially followed by an infusion of 0.1 units/kg/hour

SubQ, I.M.: Regular insulin 0.4 units/kg given half as I.V. bolus and half as SubQ or I.M., followed by 0.1 units/kg/hour SubQ or I.M.

If serum glucose does not fall by 50-70 mg/dL in the first hour, double insulin dose hourly until glucose falls at an hourly rate of 50-70 mg/dL. Decrease dose to 0.05-0.1 units/kg/hour once serum glucose reaches 250 mg/dL.

Note: Newly-diagnosed patients with IDDM presenting in DKA and patients with blood sugars <800 mg/dL may be relatively “sensitive” to insulin and should receive loading and initial maintenance doses ~50% of those indicated.

Infusion should continue until reversal of acid-base derangement/ketonemia. Serum glucose is not a direct indicator of these abnormalities, and may decrease more rapidly than correction of the range of metabolic abnormalities.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Diabetes mellitus:** Refer to adult dosing. Adolescents (growth spurts): Maintenance range: May require ≤1.5 units/kg/day in divided doses.

Diabetic ketoacidosis: Children <20 years:

I.V.: Regular insulin infused at 0.1 units/kg/hour; continue until acidosis clears, then decrease to 0.05 units/kg/hour until SubQ replacement dosing can be initiated

SubQ, I.M.: If no I.V. infusion access, regular insulin 0.1 units/kg I.M. bolus followed by 0.1 units/kg/hour SubQ or I.M.; continue until acidosis clears, then decrease to 0.05 units/kg/hour until SubQ replacement dosing can be initiated

If serum glucose does not fall by 50-70 mg/dL in the first hour, double insulin dose hourly until glucose falls at an hourly rate of 50-70 mg/dL. Decrease dose to 0.05-0.1 units/kg/hour once serum glucose reaches 250 mg/dL.

Note: Newly-diagnosed patients with IDDM presenting in DKA and patients with blood sugars <800 mg/dL may be relatively “sensitive” to insulin and should receive loading and initial maintenance doses ~50% of those indicated.

Hyperkalemia (unlabeled use): Refer to adult dosing.

Dosing: Renal ImpairmentInsulin requirements are reduced due to changes in insulin clearance or metabolism. Close monitoring of blood glucose and adjustment of therapy is required in renal impairment.

Cl_{cr} 10-50 mL/minute: Administer 75% of normal dose.

Cl_{cr} <10 mL/minute: Administer 25% to 50% of normal dose and monitor glucose closely.

Hemodialysis: Because of a large molecular weight (6000 daltons), insulin is not significantly removed by either peritoneal or hemodialysis.

Supplemental dose is not necessary.

Peritoneal dialysis: Supplemental dose is not necessary.

Continuous arteriovenous or venovenous hemofiltration effects: Supplemental dose is not necessary.

Administration: I.V.Regular insulin may be administered by SubQ, I.M., or I.V. routes.

I.V. administration (requires use of an infusion pump): May be administered I.V. with close monitoring of blood glucose and serum potassium.

Administration: I.V. DetailI.V. administration (requires use of an infusion pump): **Only regular insulin** may be administered I.V.

I.V. infusions: To minimize adsorption problems to I.V. solution bag:

If new tubing is **not** needed: Wait a minimum of 30 minutes between the preparation of the solution and the initiation of the infusion.

If new tubing is needed: After receiving the insulin drip solution, the administration set should be attached to the I.V. container and the line should be flushed with the insulin solution. The nurse should wait 30 minutes, then flush the line again with the insulin solution prior to initiating the infusion.

If insulin is required prior to the availability of the insulin drip, regular insulin should be administered by I.V. push injection.

Because of adsorption, the actual amount of insulin being administered could be substantially less than the apparent amount. Therefore, adjustment of the insulin drip rate should be based on effect and not solely on the apparent insulin dose. Furthermore, the apparent dose should not be used as the basis for determining the subsequent insulin dose upon discontinuing the insulin drip. Dose requires continuous medical supervision.

pH: Regular insulin: 7.0-7.8

Administration: OtherSubQ administration: Cold injections should be avoided. SubQ administration is usually made into the thighs, arms, buttocks, or abdomen, with sites rotated. When mixing regular insulin with other preparations of insulin, regular insulin should be drawn into syringe first. Except for rapid-acting, short-acting, or insulin detemir or glargine, gently roll vial or pen in the palms of the hands to resuspend before using. When rapid-acting insulin is mixed with an intermediate or long-acting insulin, it should be administered within 15 minutes before a meal.

Human regular insulin: Should be administered within 30-60 minutes before a meal; may be administered by SubQ, I.M., or I.V. routes

Dietary ConsiderationsDietary modification based on ADA recommendations is a part of therapy.

StorageInsulin, regular (Humulin® R, Novolin® R): Store unopened containers in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze. Vial in use may be stored under refrigeration or at room temperature; store below 30°C (86°F) away from direct heat or light. Regular insulin should only be used if clear.

ReconstitutionStandard diluent for regular insulin: 100 units/100 mL NS; **Note:** All bags should be prepared fresh; tubing should be flushed 30 minutes prior to administration to allow adsorption as time permits. Can be given as a more diluted solution (eg, 100 units/250 mL 0.45% NS).

CompatibilityA sterile diluent is available from the manufacturer for preparing dilutions of Humalog®, Humulin® N, Humulin® R, Humulin® 70/30, or Humulin® R U-500.

ContraindicationsHypersensitivity to any component of the formulation

Allergy Considerations

- Insulin Preparations Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: The most common adverse effects of insulin is hypoglycemia. The timing of hypoglycemia differs among various insulin formulations. Hypoglycemia may result from increased work or exercise without eating; use of long-acting insulin preparations (insulin detemir, insulin glargine) may delay recovery from hypoglycemia. Profound and prolonged episodes of hypoglycemia may result in convulsions, unconsciousness, temporary or permanent brain damage, or even death. Insulin requirements may be altered during illness, emotional disturbances, or other stresses.

- Hypokalemia: Insulin (especially I.V. insulin) causes a shift of potassium from the extracellular space to the intracellular space, possibly producing hypokalemia which, if left untreated, may result in respiratory paralysis, ventricular arrhythmia and even death. Use with caution in patients at risk for hypokalemia (eg, loop diuretic use). Monitor serum potassium frequently with I.V. use and supplement potassium when necessary.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Dosage requirements may be reduced.

- Renal impairment: Use with caution in patients with renal impairment. Dosage requirements may be reduced.

Dosage form specific issues:

- Product variation: Human insulin differs from animal-source insulin. Any change of insulin should be made cautiously; changing manufacturers, type, and/or method of manufacture may result in the need for a change of dosage.

Other warnings/precautions:

- Appropriate use: The general objective of exogenous insulin therapy is to approximate the physiologic pattern of insulin secretion which is characterized by two distinct phases. Phase 1 insulin secretion suppresses hepatic glucose production and phase 2 insulin secretion occurs in response to carbohydrate ingestion; therefore, exogenous insulin therapy may consist of basal insulin (eg, intermediate- or long-acting insulin or continuous insulin infusion administered via an external SubQ insulin infusion pump) and/or preprandial insulin (eg, short- or rapid-acting insulin) (see Related Information: Insulin Products). Patients with type 1 diabetes do not produce endogenous insulin; therefore, these patients require both basal and preprandial insulin administration. Patients with type 2 diabetes retain some beta-cell function in the early stages of their disease; however, as the disease progresses, phase 1 insulin secretion may become completely impaired and phase 2 insulin secretion becomes delayed and/or inadequate in response to meals. Therefore, patients with type 2 diabetes may be treated with oral antidiabetic agents, basal insulin, and/or preprandial insulin depending on the stage of disease and current glycemic control. Since treatment regimens often consist of multiple agents, dosage adjustments must address the specific phase of insulin release that is primarily contributing to the patient's impaired glycemic control. Treatment and monitoring regimens must be individualized.

- I.V. administration: Regular insulin may be administered I.V. in selected clinical situations to control hyperglycemia; close medical supervision is required.

- Patient education: Diabetic education and nutritional counseling are essential to maximize the effectiveness of therapy.

Geriatric ConsiderationsHow "tightly" a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and any other disease states. Patients who are unable to accurately draw up their dose will need assistance such as prefilled syringes. Initial doses may require considerations for renal function in the elderly with dosing adjusted subsequently based on blood glucose monitoring. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsInsulin has not been found to cross the placenta, but insulin bound to anti-insulin antibodies has been detected in cord blood. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Insulin requirements tend to fall during the first trimester of pregnancy and increase in the later trimesters, peaking at 28-32 weeks of gestation. Following delivery, insulin requirements decrease rapidly. Diabetes can be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the fetus and the mother. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/compatible

Breast-Feeding ConsiderationsEndogenous insulin can be found in breast milk. Plasma glucose concentrations in the mother affect glucose concentrations in breast milk. The gastrointestinal tract destroys insulin when administered orally; therefore, insulin is not expected to be absorbed intact by the breast-feeding infant. All types of insulin are safe for use while breast-feeding. Due to increased calorie expenditure, women with diabetes may require less insulin while nursing.

Pregnancy & Lactation, In-Depth

- Insulin Regular in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, pallor, tachycardia

Central nervous system: Fatigue, headache, hypothermia, loss of consciousness, mental confusion

Dermatologic: Urticaria, redness

Endocrine & metabolic: Hypoglycemia, hypokalemia

Gastrointestinal: Hunger, nausea, numbness of mouth, weight gain

Local: Atrophy or hypertrophy of SubQ fat tissue; edema, itching, pain or warmth at injection site; stinging

Neuromuscular & skeletal: Muscle weakness, paresthesia, tremor

Ocular: Transient presbyopia or blurred vision

Miscellaneous: Anaphylaxis, antibodies to insulin (no change in efficacy), diaphoresis, local allergy, systemic allergic symptoms

Metabolism/Transport Effects**Induces** CYP1A2 (weak)

Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Insulin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Beta-Blockers: May enhance the hypoglycemic effect of Insulin. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Edetate CALCIUM Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Edetate Disodium: May enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Insulin may enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol (may increase hypoglycemia).

Food: Insulin shifts potassium from extracellular to intracellular space. Decreases potassium serum concentration.

Herb/Nutraceutical: Use caution with chromium, garlic, gymnema (may increase hypoglycemia).

Monitoring ParametersUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}, lipid profile

DKA: Arterial blood gases, CBC with differential, urinalysis, serum glucose (baseline and every hour until reaches 250 mg/dL), BUN, creatinine, electrolytes, anion gap

Hyperkalemia: Serum potassium and glucose must be closely monitored to avoid hypoglycemia and/or hypokalemia.

Reference Range

Therapeutic, serum insulin (fasting): 5-20 µIU/mL (SI: 35-145 pmol/L)

Glucose, fasting:

Newborns: 60-110 mg/dL

Adults: 60-110 mg/dL

Elderly: 100-180 mg/dL

Recommendations for glycemic control, adults with type 1 diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Criteria for diagnosis of DKA:

Serum glucose: >250 mg/dL

Arterial pH: <7.3

Bicarbonate: <15 mEq/L

Moderate ketonuria or ketonemia

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypoglycemia) at regular intervals during therapy. Teach patient proper use, including appropriate injection technique and syringe/needle disposal and monitoring requirements (or refer to diabetic educator), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsUrine sugar and acetone, serum glucose, electrolytes, Hb A_{1c}, lipid profile

DKA: Arterial blood gases, CBC with differential, urinalysis, serum glucose (baseline and every hour until reaches 250 mg/dL), BUN, creatinine, electrolytes, anion gap

Hyperkalemia: Serum potassium and glucose must be closely monitored to avoid hypoglycemia and/or hypokalemia.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. It is imperative to follow other components of prescribed treatment (eg, diet and exercise regimen). Take exactly as directed. Do not change dose or discontinue unless advised by prescriber. With insulin aspart (NovoLog®), you must start eating within 5-10 minutes after injection. Insulin glulisine (Apidra™) should be administered within 15 minutes before or within 20 minutes after start of meal. If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Monitor glucose levels as directed by prescriber. Report adverse side effects, including chest pain or palpitations; persistent fatigue, confusion, headache; skin rash or redness; numbness of mouth, lips, or tongue; muscle weakness or tremors; vision changes; respiratory difficulty; or nausea, vomiting, or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Humulin® R: 100 units/mL (10 mL)

Novolin® R: 100 units/mL (3 mL) [InnoLet® prefilled syringe or PenFill® prefilled cartridge]; (10 mL) [vial]

Injection, solution [concentrate]:

Humulin® R U-500: 500 units/mL (20 mL vial)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Humulin R)

100 units/mL (10): $54.00

Solution (HumuLIN R U-500 (Concentrated))

500 units/mL (20): $235.02

Solution (Novolin R)

100 units/mL (10): $52.59

Solution (Novolin R InnoLet)

100 units/mL (3): $21.99

Solution (Novolin R PenFill)

100 units/mL (15): $121.27

Mechanism of Action

Insulin acts via specific membrane-bound receptors on target tissues to regulate metabolism of carbohydrate, protein, and fats. Insulin facilitates entry of glucose into muscle, adipose, and other tissues via hexose transporters, including GLUT4. Insulin stimulates the cellular uptake of amino acids and increases cellular permeability to several ions, including potassium, magnesium, and phosphate. By activating sodium-potassium ATPases, insulin promotes the intracellular movement of potassium.

Target organs for insulin include the liver, skeletal muscle, and adipose tissue. Within the liver, insulin stimulates hepatic glycogen synthesis through the activation of the enzymes hexokinase, phosphofructokinase, and glycogen synthase as well as the inhibition of glucose-6 phosphatase. Insulin promotes hepatic synthesis of fatty acids, which are released into the circulation as lipoproteins. Skeletal muscle effects of insulin include increased protein synthesis and increased glycogen synthesis. Within adipose tissue, insulin stimulates the processing of circulating lipoproteins to provide free fatty acids, facilitating triglyceride synthesis and storage by adipocytes. Insulin also directly inhibits the hydrolysis of triglycerides.

Normally secreted by the pancreas, insulin products are manufactured for pharmacologic use through recombinant DNA technology using either *E. coli* or *Saccharomyces cerevisiae*. Insulins are categorized based on promptness and duration of effect, including rapid-, short-, intermediate-, and long-acting insulins.

Pharmacodynamics/Kinetics

Note: Rate of absorption, onset, and duration of activity may be affected by site of injection, exercise, presence of lipodystrophy, local blood supply, and/or temperature.

Onset of action: 0.5 hours

Peak effect: 2.5-5 hours

Duration: 4-12 hours (may increase with dose)

Time to peak, plasma: 0.8-2 hours

Excretion: Urine

Pharmacotherapy Pearls

Split-mixed or basal-bolus regimens: Combination regimens which exploit differences in the onset and duration of different insulin products are commonly used to approximate physiologic secretion. In split-mixed regimens, an intermediate-acting insulin (such as NPH insulin) is administered once or twice daily and supplemented by short-acting (regular) or rapid-acting (lispro, aspart, or glulisine) insulin. Blood glucose measurements are completed several times daily. Dosages are adjusted emphasizing the individual component of the regimen which most directly influences the blood sugar in question (either the intermediate-acting component or the shorter-acting component). Fixed-ratio formulations (eg, 70/30 mix) may be used as twice daily injections in this scenario; however, the ability to titrate the dosage of an individual component is limited. A example of a “split-mixed” regimen would be 21 units of NPH plus 9 units of regular insulin in the morning and an evening meal dose consisting of 14 units of NPH plus 6 units of regular insulin.

Basal-bolus regimens are designed to more closely mimic physiologic secretion. These employ a long-acting insulin (eg, glargine) to simulate basal insulin secretion. The basal component is frequently administered at bedtime or in the early morning. This is supplemented by multiple daily injections of very rapid-acting products (lispro or aspart) immediately prior to a meal, which provides insulin at the time when nutrients are absorbed. An example of a basal-bolus regimen would be 30 units of glargine at bedtime and 12 units of lispro insulin prior to each meal.

Estimation of the effect per unit: A “Rule of 1500” has been frequently used as a means to estimate the change in blood sugar relative to each unit of insulin administered. In fact, the recommended values used in these calculations may vary from 1500-2200 (a value of 1500 is generally recommended for regular insulin while 1800 is recommended for "rapid-acting insulins"). The higher values lead to more conservative estimates of the effect per unit of insulin, and therefore lead to more cautious adjustments. The effect per unit of insulin is approximated by dividing the selected numerical value (eg, 1500-2200) by the number of units/day received by the patient. This may be used as a crude approximation of the patient’s insulin sensitivity as adjustments to individual components of the regimen are made. Each additional unit of insulin added to the corresponding insulin dose may be expected to lower the blood glucose by this amount.

To illustrate, in the “basal-bolus” regimen example presented above, the rule of 1800 would indicate an expected change of 27 mg/dL per unit of lispro insulin (the total daily insulin dose is 66 units; using the formula: 1800/66 = 27). A patient may be instructed to add additional insulin if the preprandial glucose is >125 mg/dL. For a prelunch glucose of 195 mg/dL, this would mean the patient would administer the scheduled 12 units of lispro along with an additional “correctional” 3 units for a total of 15 units prior to the meal. If correctional doses are required on a consistent basis, an adjustment of the patients diet and/or scheduled insulin dose may be necessary.

Dental Health: Effects on Dental TreatmentPatients with type 1 diabetes (insulin dependent) should be appointed for dental treatment in the morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or confusion

Mental Health: Effects on Psychiatric TreatmentMAO inhibitors may enhance the hypoglycemic effects of insulin; TCAs may antagonize the effects of insulin

Cardiovascular Considerations**Acute coronary syndromes (ACS):** Numerous studies have shown that hyperglycemia is associated with increase mortality in ACS. Although the 2004 ACC/AHA STEMI guidelines (Antman, 2004) recommend an insulin infusion to normalize blood glucose in patients with STEMI and complicated courses, no study has shown whether treatment of hyperglycemia has benefit in patients with ACS. According to a recent AHA statement, in patients admitted to an ICU with ACS, glucose should be monitored closely and it is reasonable to consider intensive insulin therapy using an insulin infusion in those patients with a serum glucose >180 mg/dL regardless of diabetes history. For patients with milder degrees of hyperglycemia, optimization of glucose may be considered. However, the precise target glucose range has not been established. Until this range is established, a serum glucose level between 90-140 mg/dL seems reasonable. Episodes of hypoglycemia should be avoided especially since hypoglycemia in ACS has been associated with high mortality (Deedwania, 2008).

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Surgical Patients: Van den Berghe and colleagues (2001) performed a single-center, prospective, randomized, controlled study in 1548 surgical intensive care patients (~63% cardiac surgery patients). Authors compared “conventional” control of blood glucose (180-200 mg/dL) versus “intensive” control of blood glucose (80-110 mg/dL). Primary outcome was ICU mortality. The authors showed an absolute ICu mortality reduction of 3.4% (8.0% vs 4.6%; p<0.04) in the intensive insulin therapy arm. Intensive insulin therapy also reduced bloodstream infections (7.8% vs 4.2%; p=0.003), acute renal failure requiring hemodialysis (8.2 vs 4.8%; p=0.007), and critical-illness polyneuropathy (51.9% vs 28.7%; p<0.001). Greatest ICU mortality reduction appeared in patients with an ICU stay >5 days, reducing mortality by 9.6% (20.2% vs 10.6%; p=0.005). Other authors have shown intensive insulin therapy to reduce morbidity and mortality after myocardial infarction and coronary bypass.

Medical Patients: Following the study conducted in surgical patients, a similar study (Van den Berghe, 2006) was done in adults admitted to the medical intensive care unit who were assumed to require at least 3 days of ICU care. The goal blood glucose was the same as the previous Van den Berghe study. The primary outcome was hospital mortality. Mortality in the ICU, 90-day mortality, days to wean from mechanical ventilation, days in ICU and hospital, new kidney injury were some of the secondary outcome measurements evaluated. A subgroup analysis was planned for patients staying in the ICU for >3 days. Twelve hundred patients were randomized to conventional versus intensive blood glucose control. Intensive insulin therapy did not significantly reduce in-hospital mortality (40% conventional treatment group vs 37.3% intensive treatment group, p=0.33). Morbidity was significantly reduced in the intensive group by the prevention of newly acquired kidney injury, accelerated weaning from mechanical ventilation and shortened stay in the ICU/hospital. For patients who stayed in the ICU for <3 days, mortality was greater in those receiving intensive insulin therapy. A subset of patients who remained in the ICU for 3 or more days was evaluated and in-hospital mortality was significantly reduced (52.5% vs 43%; p=0.009) in those who received intensive insulin therapy.

An additional study evaluated intensive insulin therapy in 537 medical ICU patients with severe sepsis. In this multicenter, two-by-two factorial design study, patients were randomized to intensive insulin therapy to maintain euglycemia (80-110 mg/dL) or conventional insulin therapy to maintain blood glucose levels between 180-200 mg/dL. For fluid resuscitation, patients were also randomized to 10% pentastarch, a low-molecular weight hydroxyethyl starch (HES), or Ringer’s lactate. The coprimary endpoints of the trial were mortality at 28 days and morbidity as measured by the Sequential Organ Failure Assessment (SOFA) score. Of note, previous studies evaluated mortality as a single primary endpoint. Some of the secondary endpoints included rate of acute renal failure, mean SOFA subscores, mechanical ventilation duration, ICU length of stay, and 90 day mortality. Severe hypoglycemia was defined as a serum glucose ≤40 mg/dL. The trial was stopped early due to an increased number of hypoglycemic events with intensive insulin therapy compared to conventional insulin therapy (17% vs 4.1%, respectively, p<0.001). In addition, there was no significant difference in the rates of mortality or mean SOFA scores. Patients receiving conventional insulin therapy were continued on the randomized resuscitation fluid (HES or Ringer’s lactate). Patients who received HES had a higher rate of renal failure and trended toward a higher rate of mortality at 90 days (Brunkhorst, 2008).

Guidelines: The American College of Endocrinology recommends patients in an intensive care setting maintain serum glucose levels ≤110 mg/dL. In other inpatient units, patients may have preprandial glucoses ≤110 mg/dL and maximal glucose ≤180 mg/dL. The 2008 Surviving Sepsis Campaign guidelines suggest targeting blood glucose levels <150 mg/dL by using a validated protocol for insulin adjustments (Grade 2C). The guidelines recommend that all patients receiving I.V. insulin should receive a glucose calorie source. Concurrently blood glucose values should be monitored every 1-2 hours until glucose values and insulin infusion rates are stable, then monitored every 4 hours thereafter (Grade 1C).

Index TermsRegular Insulin

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Interferon alfa-2a may be confused with interferon alfa-2b, interferon alfa-n3, pegylated interferon alfa-2b

Roferon-A® may be confused with Rocephin®

International issues:

Interferon alfa-2a may be confused with interferon alpha multi-subtype which is available in international markets

Pronunciation(in ter FEER on AL fa too aye)

U.S. Brand NamesRoferon®-A [DSC]

Canadian Brand NamesRoferon®-A

Pharmacologic CategoryInterferon

Use: Labeled Indications

Patients >18 years of age: Treatment of hairy cell leukemia, chronic hepatitis C

Children and Adults: Treatment of Philadelphia chromosome-positive (Ph+) chronic myelogenous leukemia (CML) in chronic phase, within 1 year of diagnosis (limited experience in children)

Use: Unlabeled/InvestigationalAdjuvant therapy for malignant melanoma; treatment of AIDS-related Kaposi's sarcoma, carcinoid tumors; bladder, cervical, and ovarian cancers; hemangioma; chronic hepatitis D; low-grade non-Hodgkin's lymphoma; multiple myeloma; renal cell carcinoma; basal and squamous cell skin cancer; cutaneous T-cell lymphoma

Dosing: AdultsRefer to individual protocols.

Hairy cell leukemia: SubQ: 3 million units/day for 16-24 weeks, then 3 million units 3 times/week for up to 6-24 months

Ph+ chronic myelogenous leukemia (CML): SubQ: 9 million units/day, continue treatment until disease progression **or** 3 million units/day for 3 days, followed by 6 million units/day for 3 days, followed by 9 million units daily until disease progression

AIDS-related Kaposi's sarcoma (unlabeled use): SubQ, I.M.: 36 million units/day for 10-12 weeks, then 36 million units 3 times/week; to minimize adverse reactions, can use escalating dose (3-, 9-, then 18 million units each day for 3 days, then 36 million units daily thereafter).

Chronic hepatitis C: SubQ: 3 million units 3 times/week for 12 months **or** 6 million units 3 times/week for 12 weeks followed by 3 million units 3 times/week for 36 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. Children (limited data):

Ph+ chronic myelogenous leukemia (CML): I.M.: 2.5-5 million units/m^2/day. **Note:** In juveniles, higher dosages (30 million units/m^2/day) have been associated with severe adverse events, including death.

Dosing: Renal ImpairmentNot removed by hemodialysis

Dosing: Combination Regimens

Leukemia, acute lymphocytic: Hyper-CVAD (Leukemia, Acute Lymphocytic)

Renal cell cancer:

Bevacizumab-Interferon Alfa-2a

Interleukin 2-Interferon Alfa-2

Melanoma: CVD-Interleukin-Interferon (Melanoma)

Calculations

- Body Surface Area: Pediatrics

Administration: I.M.May also be administered I.M. (unlabeled route).

Administration: OtherFor SubQ administration, rotate SubQ injection site

StorageRefrigerate (2°C to 8°C/36°F to 46°F); do not freeze. Protect from light. Do not shake.

CompatibilityStable in LR, NS; **incompatible** with D_5W.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to interferon alfa or any component of the formulation; autoimmune hepatitis; hepatic decompensation (Child-Pugh class B or C)

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Boxed warnings:

- Autoimmune disease: See "Disease-related concerns" below.
- Infectious disorders: See "Disease-related concerns" below.
- Ischemic disorders: See "Disease-related concerns" below.
- Neuropsychiatric disorders: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Causes bone marrow suppression, including potentially severe cytopenias, and very rarely, aplastic anemia. Use caution in patients with pre-existing myelosuppression and/or with concomitant medications which cause myelosuppression.
- Flu-like symptoms: Commonly associated with flu-like symptoms, including fever; rule out other causes/infection with persistent or high fever.
- Gastrointestinal effects: Gastrointestinal hemorrhage, ulcerative and hemorrhagic/ischemic colitis have been observed with interferon alfa treatment; may be severe and/or life-threatening; discontinue if symptoms (eg, abdominal pain, bloody diarrhea, and/or fever) develop.
- Hepatic effects: Transient liver abnormalities may occur when treating chronic hepatitis C with interferon alfa-2a; increased ascites, hepatic failure, and death may occur with poorly-compensated liver disease.
- Hypersensitivity: Acute hypersensitivity reactions have been reported (rarely) with alfa interferons.
- Hypertriglyceridemia: Has been reported (discontinue if severe, particularly if combined with symptoms of pancreatitis).
- Infections: Serious and severe infections (bacterial, viral and fungal) have been reported with treatment; evaluate and treat promptly; consider discontinuing interferon.
- Nephrotoxicity: Renal toxicities, some requiring dialysis, have been reported with interferon alfa (alone or in combination with interleukin-2); monitor closely for signs/symptoms of toxicity.
- Neuropsychiatric disorders: **[U.S. Boxed Warning]: May cause severe psychiatric adverse events (eg, depression, psychosis, mania, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms;** use with extreme caution in patients with a history of depression. Careful neuropsychiatric monitoring is required during therapy. Patients developing severe depression may require discontinuation of treatment. Although dose reduction or discontinuation may resolve symptoms, depression may persist; suicides have been reported after therapy has been discontinued. Use with caution in patients with seizure disorders, brain metastases, or compromised CNS function. Higher doses in the elderly or in malignancies other than hairy cell leukemia may result in severe obtundation.
- Ocular effects: Decreased/loss of vision, retinopathy (including macular edema), retinal artery or vein thrombosis, retinal hemorrhages, cotton wool spots, optic neuritis and papilledema have occurred in patients receiving interferon alfa. Use caution in patients with pre-existing ophthalmic disorders; monitor closely and discontinue with new or worsening ophthalmic symptoms.
- Pancreatitis: Has been observed (occasionally fatal); hypertriglyceridemia increases the risk for pancreatitis; consider discontinuing treatment in patients with pancreatitis.
- Pulmonary effects: Dyspnea, pulmonary infiltrates, pneumonia, bronchiolitis obliterans, interstitial pneumonia, and sarcoidosis, resulting in potential fatal respiratory failure may occur with interferon alfa treatment. Discontinue with unexplained pulmonary infiltrates or evidence of impaired pulmonary function. Use caution in patients with a history of pulmonary disease.

Disease-related concerns:

- Autoimmune disease: **[U.S. Boxed Warning]: Avoid use in patients with history of autoimmune disorders.** Development or exacerbation of autoimmune disorders (thrombocytopenic purpura, vasculitis, Raynaud's disease, rheumatoid arthritis, interstitial nephritis, thyroiditis, lupus erythematosus, and rhabdomyolysis) has been associated with interferon alfa. Monitor closely and consider discontinuing if autoimmune disease develops.
- Cardiovascular disease: Use with caution and monitor closely in patients with history of cardiovascular disease; acute toxicities may exacerbate pre-existing cardiac conditions. MI has been observed (rarely) in patients receiving interferon alfa-2a; cardiomyopathy has been reported (rarely) in patients receiving interferon alfa.
- Diabetes: Use with caution in patients with diabetes mellitus; hyperglycemia has been reported which may require adjustments in

medications.

- Infectious disorders: **[U.S. Boxed Warning]: May cause or aggravate fatal or life-threatening infectious disorders;** discontinue treatment for persistent severe or worsening symptoms.
- Ischemic disorders: **[U.S. Boxed Warning]: May cause or aggravate fatal or life-threatening ischemic disorders;** discontinue treatment for persistent severe or worsening symptoms.
- Renal impairment: Use with caution in patients with renal impairment (Cl_{cr} <50 mL/minute).
- Thyroid disorders: Use with caution in patients with pre-existing thyroid disease; thyroid disorders (hyper- or hypothyroidism) have been reported.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years for uses other than Ph+ CML.
- Transplant recipients: Safety and efficacy have not been established in organ transplant recipients.

Dosage form specific issues:

- Benzyl alcohol: Injection solution contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.
- Product variability: **Due to differences in dosage, patients should not change brands of interferons without the concurrence of their healthcare provider.**

Geriatric ConsiderationsNo specific data is available for the elderly; however, pay close attention to Warnings/Precautions since the elderly often have reduced Cl_{cr} (<50 mL/minute), diabetes, and hyper-/hypothyroidism.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated abortifacient effects in large doses. Disruption of the normal menstrual cycle was also observed in animal studies; therefore, the manufacturer recommends that reliable contraception is used in women of childbearing potential. Alfa interferon is endogenous to normal amniotic fluid. *In vitro* administration studies have reported that when administered to the mother, it does not cross the placenta. Case reports of use in pregnant women are limited. The Perinatal HIV Guidelines Working Group does not recommend that interferon-alfa be used during pregnancy. Interferon alfa-2a should only be used in pregnancy when the potential benefit to the mother justifies the possible risk to the fetus.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsBreast milk samples obtained from a lactating mother prior to and after administration of interferon alfa-2b showed that interferon alfa is present in breast milk and administration of the medication did not significantly affect endogenous levels. The AAP considers interferon alfa to be “usually compatible with breast-feeding.” Breast-feeding is not linked to the spread of hepatitis C virus; however, if nipples are cracked or bleeding, breast-feeding is not recommended. Mothers coinfected with HIV are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions**Note:** A flu-like syndrome (fever, chills, tachycardia, malaise, myalgia, arthralgia, headache) occurs within 1-2 hours of administration; may last up to 24 hours and may be dose limiting.

>10%:

Cardiovascular: Chest pain (<4% to 11%), edema (1% to 11%), hypertension (11%)

Central nervous system: Fever (28% to 92%), fatigue (58% to 88%), headache (44% to 64%), chills (23% to 64%), depression (16% to 28%), pain (24%), dizziness (11% to 21%), mental status decreased (10% to 16%), irritability (15%), insomnia (14%), sleep disturbances (10% to 11%)

Dermatologic: Rash (8% to 44%), alopecia (17% to 19%), pruritus (7% to 13%), dry skin (7% to 17%)

Endocrine & metabolic: Hypocalcemia (28%), hypophosphatemia (22%)

Gastrointestinal: Anorexia (14% to 48%), nausea (33% to 39%), vomiting (33% to 39%), diarrhea (20% to 37%), weight loss (33%), throat irritation (21%), abdominal pain (12%)

Hematologic (often due to underlying disease): Myelosuppression (onset: 7-10 days; nadir 14 days [may be delayed 20-40 days in hairy cell leukemia], recovery: 21 days), neutropenia (≤68%; dose dependant); thrombocytopenia (5% to 62%), leukopenia (2% to 45%), anemia (≤31%)

Hepatic: Alkaline phosphatase increased (≤50%), transaminases increased (≤50%)

Local: Injection site reaction (29%)

Neuromuscular & skeletal: Weakness (6% to 88%) myalgia (51% to 71%), arthralgia (47% to 51%), bone pain (25% to 47%), joint pain (25%), back pain (16%), numbness (12%), paresthesia (7% to 12%)

Respiratory: Cough (1% to 19%), rhinorrhea/rhinitis (3% to 12%), dyspnea (1% to 12%), pneumonia (11%), sinusitis (11%)

Miscellaneous: Flu-like syndrome (16% to 33%), diaphoresis (1% to 22%)

1% to 10%:

Cardiovascular: Dysrhythmia (7%), hypotension (<5%), syncope (<5%), murmur (<5%), thrombophlebitis (<5%), palpitations (<3%), vasculitis (<3%), arrhythmia (1%)

Central nervous system: Confusion (<4% to 7%), anxiety (5% to 6%), lethargy (1% to 6%), nervousness (<5%), vertigo (<5%), concentration impaired (4%), memory loss (<4%), seizure (<4%), behavior disturbances (3%), malaise (1%)

Dermatologic: Bruising (<4%), skin lesions (1% to 3%)

Endocrine & metabolic: Hyperphosphatemia (9%), diabetes (<5%), hyper-/hypothyroidism (<5%), hypertriglyceridemia (<4%), libido changes (<4%), sexual dysfunction (1% to 3%), menstrual irregularity (2%)

Gastrointestinal: Colitis (<5%), gastrointestinal hemorrhage (<5%), pancreatitis (<5%), flatulence (3%), taste change (3% to <4%), stomatitis (1% to <5%), constipation (<3%), digestion impaired (2%), gingival bleeding (≤2%)

Genitourinary: Impotence (<4%), urinary tract infection (1% to 3%)

Hematologic: Coagulopathy (<4%), hemolytic anemia (<3%), hematoma (1%)

Hepatic: Liver pain (3%)

Neuromuscular & skeletal: Involuntary movements (7%), arthritis (≤5%), polyarthritis (5%), gait disturbance (<5%), leg cramps (3%), muscle cramps (1% to 3%)

Ocular: Visual disturbance (6%), conjunctivitis (4%), eye pain (1% to 3%)

Otic: Hearing alteration (<4%)

Renal: Proteinuria (≤10%)

Respiratory: Oropharynx dryness/inflammation (6%), pneumonitis (<5%), epistaxis (≤4%), bronchospasm (<4%), chest congestion (<3%)

Miscellaneous: Herpes virus reactivation (1% to 3%), lupus erythematosus syndrome (<3%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anaphylactic reaction, anaphylaxis, angioedema, aplastic anemia, ascites, autoimmune reaction with worsening of liver disease, bronchiolitis obliterans, BUN/creatinine increased, cardiomyopathy, coma, CHF, cutaneous eruptions, cyanosis, dysphasia, EEG abnormalities, encephalopathy, hallucinations, hearing loss, hemolytic anemia (Coombs' positive), hemorrhagic colitis, hepatic failure, hepatitis, hyperglycemia, hyperlipidemia, hypersensitivity, hyponatremia (SIADH), inflammation (injection site), macular edema, mania, idiopathic thrombocytopenia purpura, interstitial nephritis, interstitial pneumonitis, ischemic colitis, ischemic retinopathy, LDH increased, MI, myositis, nephrotic syndrome, obtundation, optic neuritis, petechiae, pneumonia, pneumonitis, presenile dementia, proteinuria, psoriasis, psychomotor retardation, psychotic episodes, pulmonary edema, pulmonary infiltrates, Raynaud's phenomenon, renal failure (acute), retinopathy, rhabdomyolysis, sarcoidosis, seizure, serum creatinine increased, somnolence, stroke, suicidal behavior/ideation, syncope, tachypnea, transient ischemic attacks, ulcerative colitis, uric acid increased, urticaria (injection site), vasculitis, visual acuity decreased

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Inhibits** CYP1A2 (weak)
Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersCBC with differential and platelets, liver function, electrolytes, triglycerides. Baseline chest x-ray and ECG. Baseline ophthalmologic exam should be performed in all patients, with periodic reassessment in patients with impairment. Patients with thyroid dysfunction should be monitored by TSH levels at baseline and every 3 months during therapy.

Chronic hepatitis C: Monitor ALT (at baseline, after 2 weeks, and monthly thereafter) and HCV-RNA (particularly in first 3 months of therapy)

CML/hairy cell leukemia: Hematologic monitoring should be performed monthly

Nursing: Physical Assessment/MonitoringAssess laboratory results on a regular basis. Monitor for effectiveness of therapy and possible adverse reactions. Monitor for neuropsychiatric changes. Monitor for signs of depression or suicidal ideation. Perform eye exam prior to initiating therapy and periodically during treatment. Monitor weight periodically. Patients with pre-existing cardiac abnormalities or advanced stages of cancer should have ECG before and during treatment. Assess knowledge/instruct patient/caregiver on appropriate reconstitution, injection and needle disposal, possible side effects, and symptoms to report.
Monitoring: Lab TestsBaseline chest x-ray, ECG, CBC with differential and platelets, liver function, electrolytes, triglycerides, TSH (if pre-existing thyroid dysfunction)
Patient EducationUse as directed; do not change dosage, brand, or schedule of administration without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience flu-like syndrome (acetaminophen may help); nausea, vomiting, dry mouth, or metallic taste (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or drowsiness, dizziness, agitation, abnormal thinking (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Inform prescriber **immediately** if you feel depressed or have any thoughts of suicide. Report unusual bruising or bleeding; persistent abdominal disturbances; unusual fatigue; muscle pain or tremors; chest pain or palpitation; swelling of extremities or unusual weight gain; respiratory difficulty; pain, swelling, or redness at injection site; change in vision; or other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution:

Roferon®-A: 3 million units/0.5 mL (0.5 mL) [contains benzyl alcohol and polysorbate 80] [DSC]; 6 million units/0.5 mL (0.5 mL) [contains benzyl alcohol and polysorbate 80] [DSC]; 9 million units/0.5 mL (0.5 mL) [contains benzyl alcohol and polysorbate 80] [DSC]

Generic AvailableNo
ManufacturerRoche Laboratories Inc
Pricing: U.S. (www.drugstore.com)

Kit (Roferon-A)

9000000 units/0.5 mL (1): $131.99

Mechanism of ActionFollowing activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells

Pharmacodynamics/Kinetics

Distribution: V_d: 0.223-0.748 L/kg

Metabolism: Primarily renal; filtered through glomeruli and undergoes rapid proteolytic degradation during tubular reabsorption

Bioavailability: I.M.: 83%; SubQ: 90%

Half-life elimination: I.V.: 3.7-8.5 hours (mean ~5 hours)

Time to peak, serum: I.M., SubQ: ~4-7 hours

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation), metallic taste, taste change, loss of taste, cough, irritation of oropharynx, dry throat, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSevere psychiatric disorders including depression, suicidal behavior, ideation, attempts, and suicides have been reported with alfa interferons in patients with and without a previous psychiatric history. Extreme caution should be used in individuals who report a history of depression and patients should be informed of these potential side effects and how to respond if they occur. Careful neuropsychiatric monitoring for depressive symptoms is recommended. Dizziness and drowsiness are common. May cause memory impairment, agitation, manic behavior, and psychotic reactions; may rarely cause delirium.

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation and dry mouth

Anesthesia and Critical Care Concerns/Other ConsiderationsIndications and dosage regimens are specific for a particular brand of interferon; other brands have different indications and dosage guidelines.

Index TermsIFLrA; Interferon Alpha-2a; NSC-367982; rIFN-A

Pronunciation(in ter FEER on AL fa too bee & rye ba VYE rin)

U.S. Brand NamesRebetron®

Pharmacologic CategoryAntiviral Agent; Interferon

Use: Labeled IndicationsCombination therapy for the treatment of chronic hepatitis C in patients with compensated liver disease previously untreated with alpha interferon or who have relapsed after alpha interferon therapy

Dosing: Adults

Chronic hepatitis C: Recommended dosage of combination therapy:

- *Intron® A:* SubQ: 3 million int. units 3 times/week **and**
- *Rebetol® capsule:* Oral:
  - ≤75 kg (165 pounds): 1000 mg/day (two 200 mg capsules in the morning and three 200 mg capsules in the evening)
  - >75 kg: 1200 mg/day (three 200 mg capsules in the morning and three 200 mg capsules in the evening)
- **Note:** Treatment duration may vary. Consult current guidelines and literature.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Chronic hepatitis C:**

Children ≥3 years: **Note:** Treatment duration may vary. Consult current guidelines and literature. Combination therapy:

- *Intron® A:* SubQ:
  - 25-61 kg: 3 million int. units/m^2 3 times/week
  - >61 kg: Refer to adult dosing
- *Rebetol®:* Oral: **Note:** Oral solution should be used in children 3-5 years of age, children ≤25 kg, or those unable to swallow capsules.
  - Capsule/solution: 15 mg/kg/day in 2 divided doses (morning and evening)
  - Capsule dosing recommendations:
    - 26-36 kg: 400 mg/day (200 mg morning and evening)
    - 37-49 kg: 600 mg/day (200 mg in the morning and two 200 mg capsules in the evening)
    - 50-61 kg: 800 mg/day (two 200 mg capsules morning and evening)
    - >61 kg: Refer to adult dosing.

Dosing: Renal ImpairmentPatients with Cl_{cr} <50 mL/minutes should not receive ribavirin.

Dosing: Adjustment for Toxicity**Note:** Recommendations (per manufacturer labeling):

Anemia (RBC depression):

- Patient **without** cardiac history:
  - Hemoglobin <10 g/dL:
    - Children: Decrease dose by $^1/_2$
    - Adults: Decrease dose to 600 mg/day
  - Hemoglobin <8.5 g/dL: Permanently discontinue treatment
- Patient **with** cardiac history:
  - Hemoglobin has ≥2 g/dL decrease during any 4-week period of treatment:
    - Children: Decrease ribavirin dose by $^1/_2$**and** decrease interferon alfa-2b to 1.5 million int. units 3 times/week
    - Adults: Decrease dose to ribavirin to 600 mg/day **and** decrease interferon-alfa 2b dose to 1.5 million int. units 3 times/week.

Hemoglobin <12 g/dL after 4 weeks of reduced dose: Permanently discontinue treatment

WBC, neutrophil, or platelet depression:

WBC <1500 cells/mm^3, neutrophils <750 cells/mm^3, or platelet count <50,000 cells/ mm^3 (<80,000 cells/mm^3 in children): Reduce interferon alfa-2b dose to 1.5 million int. units 3 times/week (50% reduction)

WBC <1000 cells/mm^3, neutrophils <500 cells/mm^3, or platelet count <25,000 cells/mm^3 (<50,000 cells/mm^3 in children): Permanently discontinue therapy

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralCapsule should not be opened, crushed, chewed, or broken. Capsules are not for use in children <5 years of age. Use oral solution for children 3-5 years, those ≤25 kg, or those who cannot swallow capsules.

Administration: OtherSee individual agents.

Dietary ConsiderationsTake oral formulation without regard to food, but always in a consistent manner with respect to food intake (ie, always take with food or always take on an empty stomach).

StorageStore the Rebetol® capsules plus Intron® A injection combination package refrigerated between 2°C and 8°C (36°F and 46°F).

When separated, the individual carton of Rebetol® capsules should be stored refrigerated between 2°C and 8°C (36°F and 46°F) or at 25°C (77°F); excursions are permitted between 15°C and 30°C (59°F and 86°F).

When separated, the individual carton or vial of Intron® A injection and the Intron® A multidose pen should be stored refrigerated between 2°C and 8°C (36°F and 46°F).

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) for treatment of hepatitis C where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to interferon alfa-2b, ribavirin, or any component of the formulation; autoimmune hepatitis; males with a pregnant female partner; pregnancy

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Boxed warnings:

- Autoimmune disease: See "Disease-related concerns" below.
- Hepatic impairment: See "Disease-related concerns" below.
- Hemolytic anemia: See "Concerns related to adverse effects" below.
- Infectious disorders: See "Disease-related concerns" below.
- Ischemic disorders: See "Disease-related concerns" below.
- Neuropsychiatric disorders: See "Concerns related to adverse effects" below.
- Pregnancy: See "Special populations" below.
- Pulmonary symptoms: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Bone marrow suppression: Intron® A may cause bone marrow suppression, including very rarely, aplastic anemia. Anemia has been observed in patients receiving the interferon/ribavirin combination. Use with caution in patients with myelosuppression.
- CNS toxicity: Higher doses of interferon alfa-2b in diseases other than hairy cell leukemia, may result in increased CNS toxicity.
- Dental/periodontal disorders: Have been reported with ribavirin and interferon therapy; patients should be instructed to brush teeth twice daily and have regular dental exams.
- Hemolytic anemia: **[U.S. Boxed Warning]: Hemolytic anemia is a significant toxicity of ribavirin; usually occurring within 1-2 weeks.** Assess cardiac disease before initiation. Anemia may worsen underlying cardiac disease; use caution. If any deterioration in cardiovascular status occurs, discontinue therapy. Patients with renal dysfunction and/or those >50 years of age should be carefully assessed for development of anemia. Hemolytic anemia (hemoglobin <10 g/dL) was observed in up to 10% of treated patients in clinical trials when interferon alfa-2b was combined with ribavirin.
- Hypertriglyceridemia: Has been reported with interferon alfa-2b; discontinue if severe.
- Neuropsychiatric disorders: **[U.S. Boxed Warning]: Interferon alfa-2b may cause severe psychiatric adverse events (psychosis, mania, depression, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms, avoid use in severe psychiatric disorders or in patients with a history of depression;** careful neuropsychiatric monitoring is required during therapy. Suicidal ideation or attempts may occur more frequently in pediatric patients when compared to adults. Severe psychiatric events have also occurred with ribavirin.

- Ocular effects: Ophthalmologic disorders (including retinal hemorrhages, cotton wool spots and retinal artery or vein obstruction) have occurred in patients receiving alpha interferons.

- Pancreatitis: Discontinue ribavirin therapy in suspected/confirmed pancreatitis.

- Pulmonary symptoms: **[U.S. Boxed Warning]: Interferon alfa-2b treatment should be discontinued in patients who develop severe pulmonary symptoms with chest x-ray changes;** use the combination with caution in patients with pulmonary disease; pulmonary symptoms have been associated with administration.

Disease-related concerns:

- Autoimmune disease: **[U.S. Boxed Warning]: Interferon alfa-2b treatment should be discontinued in patients who develop severe autoimmune disorders.** Avoid use in patients with autoimmune disorders; worsening of psoriasis and/or development of autoimmune disorders has been associated with alpha interferons.

- Bleeding disorders: Use interferon alfa-2b with caution in patients with a history of coagulopathy.

- Cardiovascular disease: Use interferon alfa-2b with caution in patients with cardiac disease (ischemic or thromboembolic), hypertension or arrhythmias.

- CNS disorders: Use interferon alfa-2b with caution in patients with a history of seizures, brain metastases, or multiple sclerosis.

- Diabetes: Use interferon alfa-2b with caution in patients with a history of diabetes mellitus (particularly if prone to DKA).

- Hepatic impairment: **[U.S. Boxed Warning]: Interferon alfa-2b treatment should be discontinued in patients who develop worsening of hepatic function;** use with caution in patients with hepatic impairment. Safety and efficacy of ribavirin have not been established in patients with decompensated liver disease.

- Hepatitis: Safety and efficacy of ribavirin have not been established in patients with concurrent hepatitis B virus. A transient increase in AST (>2x baseline) is common in patients treated with interferon alfa-2b for chronic hepatitis. Therapy generally may continue, however, functional indicators (albumin, prothrombin time, bilirubin) should be monitored at 2-week intervals.

- HIV: Safety and efficacy of ribavirin have not been established in patients with HIV exposure. Do use interferon alfa-2b to treat patients with visceral AIDS-related Kaposi's sarcoma associated with rapidly-progressing or life-threatening disease.

- Infectious disorders: **[U.S. Boxed Warning]: Interferon alfa-2b treatment should be discontinued in patients with worsening or persistently severe signs/symptoms of infectious disorders.**

- Ischemic disorders: **[U.S. Boxed Warning]: Interferon alfa-2b treatment should be discontinued in patients with worsening or persistently severe signs/symptoms of ischemic disorders.**

- Renal impairment: Use interferon alfa-2b with caution in patients with renal impairment; use is not recommended if Cl_{cr}<50 mL/minute.

- Sarcoidosis: Use ribavirin with caution in patients with sarcoidosis (exacerbation reported).

- Thyroid disease: Use interferon alfa-2b with caution in patients with a history of thyroid disease; monitor closely.

Concurrent drug therapy issues:

- Medications causing lactic acidosis: Use with caution in patient receiving medications which may cause lactic acidosis (eg, nucleoside analogues).

Special populations:

- Elderly: Use ribavirin with caution in elderly patients; higher frequency of anemia; take renal function into consideration before initiating. Use higher doses of interferon alfa-2b with caution in the elderly; may cause CNS toxicity.

- Organ transplant recipients: Safety and efficacy of ribavirin have not been established in organ transplant patients.

- Pediatrics: Safety and efficacy have not been established in children <3 years.

- Pregnancy: **[U.S. Boxed Warning]: Avoid pregnancy in female patients and female partners of patients during ribavirin therapy.** Negative pregnancy test is required before initiation and monthly thereafter.

Dosage form specific issues:

- Product variability: **Due to differences in dosage, patients should not change brands of interferons.**

Pregnancy Risk FactorX

Pregnancy ConsiderationsAbortifacient and teratogenic effects have been reported with ribavirin. Negative pregnancy test is required before initiation and monthly thereafter. Avoid pregnancy in female patients and female partners of patients during therapy by using two effective forms of contraception; continue contraceptive measures for at least 6 months after completion of therapy. If patient or female partner becomes pregnant during treatment, she should be counseled about potential risks of exposure. Pregnancies that occur during use, or within 6 months after treatment, should be reported to the manufacturer (800-593-2214).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsWomen with hepatitis C should be instructed that there is a theoretical risk the virus may be transmitted in breast milk.

Adverse Reactions**Note:** Adverse reactions listed are specific to combination regimen in previously untreated hepatitis patients. See individual agents for additional adverse reactions reported with each agent during therapy for other diseases.

>10%:

Central nervous system: Fatigue (children 61%; adults 68%), headache (63%), insomnia (children 14%; adults 39%), fever (children 61%; adults 37%), depression (children 13%; adults 32% to 36%), irritability (children 10%; adults 23% to 32%), dizziness (17% to 23%), emotional lability (children 16%; adults 7% to 11%), impaired concentration (5% to 14%)

Dermatologic: Alopecia (23% to 32%), pruritus (children 12%; adults 19% to 21%), rash (17% to 28%)

Gastrointestinal: Nausea (33% to 46%), anorexia (children 51%; adults 25% to 27%), dyspepsia (children <1%; adults 14% to 16%), vomiting (children 42%; adults 9% to 11%)

Hematologic: Leukopenia, neutropenia (usually recovers within 4 weeks of treatment discontinuation), anemia

Hepatic: Hyperbilirubinemia (27%; only 0.9% to 2% >3.0-6 mg/dL)

Local: Injection site inflammation (13%)

Neuromuscular & skeletal: Myalgia (children 32%; adults 61% to 64%), rigors (40%), arthralgia (children 15%; adults 30% to 33%), musculoskeletal pain (20% to 28%)

Respiratory: Dyspnea (children 5%; adults 18% to 19%)

Miscellaneous: Flu-like syndrome (children 31%; adults 14% to 18%)

1% to 10%:

Cardiovascular: Chest pain (5% to 9%)

Central nervous system: Nervousness (3% to 4%)

Endocrine & metabolic: Thyroid abnormalities (hyper- or hypothyroidism), serum uric acid increased, hyperglycemia

Gastrointestinal: Taste perversion (children <1%; adults 7% to 8%)

Hematologic: Hemolytic anemia (10%), thrombocytopenia

Local: Injection site reaction (7%)

Neuromuscular & skeletal: Weakness (5% to 9%)

Respiratory: Sinusitis (children <1%; adults 9% to 10%)

<1%: Acute hypersensitivity reactions, anaphylaxis, angioedema, aplastic anemia (very rare), arrhythmia, bronchoconstriction, cardiomyopathy, cotton wool spots, diabetes, hearing loss, hepatotoxic reactions, hypotension, MI, pneumonia, pneumonitis, retinal hemorrhages, retinal artery or vein obstruction, severe psychiatric reactions, suicidal behavior, suicidal ideation, tinnitus, urticaria; rare cases of autoimmune diseases including vasculitis, polyarteritis reaction, rheumatoid arthritis, lupus erythematosus, and Raynaud's phenomenon

Postmarketing and/or case reports: Dental disorders, hypertriglyceridemia, nephrotic syndrome, pancreatitis, periodontal disorders, hallucinations, renal failure, sarcoidosis (including exacerbations of sarcoidosis)

Metabolism/Transport EffectsInterferon Alfa-2b: **Inhibits** CYP1A2 (weak)

Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Interferons (Alfa): May enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Reverse Transcriptase Inhibitors (Nucleoside): Ribavirin may enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersObtain pretreatment CBC, liver function tests, TSH, and electrolytes and monitor routinely throughout therapy (at 2 weeks and 4 weeks, more frequently if indicated); discontinue if WBC <1.0 x 10^9/L, neutrophils <0.5 x 10^9/L, platelets <25 x 10^9/L, or if hemoglobin <8.5 g/dL (in cardiac patients, discontinue if hemoglobin <12 g/dL after 4 weeks of dosage reduction). Pretreatment and monthly pregnancy test for women of childbearing age. Baseline chest x-ray, ECG, weight; patients with pre-existing cardiac abnormalities, or in advanced stages of cancer should have ECGs taken before and during treatment; reticulocyte count, serum HCV RNA levels; I & O; dental exams

Reference RangePeak serum level after I.V. infusion of 10 million units: 546 units/mL

Early viral response (EVR): >2 log decrease in HCV RNA after 12 weeks of treatment

End of treatment response (ETR): Absence of detectable HCV RNA at end of the recommended treatment period

Sustained treatment response (STR): Absence of HCV RNA in the serum 6 months following completion of full treatment course

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsObtain pretreatment CBC, liver function tests, TSH, and electrolytes and monitor routinely throughout therapy (at 2 weeks and 4 weeks, more frequently if indicated); discontinue if WBC <1.0 x 10^9/L, neutrophils <0.5 x 10^9/L, platelets <25 x 10^9/L, or if hemoglobin <8.5 g/dL (in cardiac patients, discontinue if hemoglobin <12 g/dL after 4 weeks of dosage reduction). Pretreatment and monthly pregnancy test for women of childbearing age. Reticulocyte count, serum HCV RNA levels

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Combination package:

For patients ≤75 kg [contains single-dose vials]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.5 mL (0.5 mL) [6 vials (3 million int. units/vial), 6 syringes, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (70s)

For patients ≤75 kg [contains multidose vials]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.5 mL (3.8 mL) [1 multidose vial (18 million int. units/vial), 6 syringes, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (70s)

For patients ≤75 kg [contains multidose pen]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.2 mL (1.5 mL) [1 multidose pen (18 million int. units/pen), 6 needles, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (70s)

For patients >75 kg [contains single-dose vials]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.5 mL (0.5 mL) [6 vials (3 million int. units/vial), 6 syringes, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (84s)

For patients >75 kg [contains multidose vials]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.5 mL (3.8 mL) [1 multidose vial (18 million int. units/vial), 6 syringes, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (84s)

For patients >75 kg [contains multidose pen]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.2 mL (1.5 mL) [1 multidose pen (18 million int. units/pen), 6 needles, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (84s)

For Rebetol® dose reduction [contains single-dose vials]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.5 mL (0.5 mL) [6 vials (3 million int. units/vial), 6 syringes, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (42s)

For Rebetol® dose reduction [contains multidose vials]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.5 mL (3.8 mL) [1 multidose vial (18 million int. units/vial), 6 syringes, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (42s)

For Rebetol® dose reduction [contains multidose pen]:

Injection, solution: Interferon alfa-2b (Intron® A): 3 million int. units/0.2 mL (1.5 mL) [1 multidose pen (18 million int. units/pen), 6 needles, and alcohol swabs]

Capsule: Ribavirin (Rebetol®): 200 mg (42s)

Generic AvailableNo

Mechanism of Action

Interferon Alfa-2b: Alpha interferons are a family of proteins, produced by nucleated cells, that have antiviral, antiproliferative, and immune-regulating activity. There are 16 known subtypes of alpha interferons. Interferons interact with cells through high affinity cell surface receptors. Following activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells

Ribavirin: Inhibits replication of RNA and DNA viruses; inhibits influenza virus RNA polymerase activity and inhibits the initiation and elongation of RNA fragments resulting in inhibition of viral protein synthesis

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), metallic taste, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSevere psychiatric disorders, including depression and suicidal behavior, have been associated with interferon use. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsInterferon Alfa-2b and Ribavirin Combination Pack; Ribavirin and Interferon Alfa-2b Combination Pack

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Interferon alfa-2b may be confused with interferon alfa-2a, interferon alfa-n3, pegylated interferon alfa-2b

Intron® A may be confused with PEG-Intron®

International issues:

Interferon alfa-2b may be confused with interferon alpha multi-subtype which is available in international markets

Pronunciation(in ter FEER on AL fa too bee)

U.S. Brand NamesIntron® A

Canadian Brand NamesIntron® A

Pharmacologic CategoryInterferon

Use: Labeled Indications

Patients ≥1 year of age: Chronic hepatitis B

Patients ≥3 years of age: Chronic hepatitis C (in combination with ribavirin)

Patients ≥18 years of age: Condyloma acuminata, chronic hepatitis B, chronic hepatitis C, hairy cell leukemia, malignant melanoma, AIDS-related Kaposi's sarcoma, follicular non-Hodgkin's lymphoma

Use: Unlabeled/InvestigationalAIDS-related thrombocytopenia, cutaneous ulcerations of Behçet's disease, neuroendocrine tumors (including carcinoid syndrome and islet cell tumor), cutaneous T-cell lymphoma, desmoid tumor, lymphomatoid granulomatosis, hepatitis D, chronic myelogenous leukemia (CML), non-Hodgkin's lymphomas (other than follicular lymphoma, see approved use), multiple myeloma, renal cell carcinoma, basal and squamous cell skin cancers, West Nile virus

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted. **Note:** Withhold treatment for ANC <500/mm^3 or platelets <25,000/mm^3. Consider premedication with acetaminophen prior to administration to reduce the incidence of some adverse reactions. Not all dosage forms and strengths are appropriate for all indications; refer to product labeling for details.

Hairy cell leukemia: I.M., SubQ: 2 million units/m^2 3 times/week for up to 6 months (may continue treatment with continued treatment response)

Lymphoma (follicular): SubQ: 5 million units 3 times/week for up to 18 months

Malignant melanoma: Induction: 20 million units/m^2 I.V. for 5 consecutive days per week for 4 weeks, followed by maintenance dosing of 10 million units/m^2 SubQ 3 times/week for 48 weeks

AIDS-related Kaposi's sarcoma: I.M., SubQ: 30 million units/m^2 3 times/week

Chronic hepatitis B: I.M., SubQ: 5 million units/day or 10 million units 3 times/week for 16 weeks

Chronic hepatitis C: I.M., SubQ: 3 million units 3 times/week for 16 weeks. In patients with normalization of ALT at 16 weeks, continue treatment for 18-24 months; consider discontinuation if normalization does not occur at 16 weeks. **Note:** May be used in combination therapy with ribavirin in previously untreated patients or in patients who relapse following alpha interferon therapy.

Condyloma acuminata: Intralesionally: 1 million units/lesion (maximum: 5 lesions/treatment) 3 times/week (on alternate days) for 3 weeks. May administer a second course at 12-16 weeks.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDetails concerning dosing in combination regimens should also be consulted.

Chronic hepatitis B: SubQ: Children 1-17 years: 3 million units/m^2 3 times/week for 1 week; then 6 million units/m^2 3 times/week; maximum: 10 million units 3 times/week; total duration of therapy 16-24 weeks

Dosing: Renal ImpairmentCombination therapy with ribavirin (hepatitis C) should not be used in patients with reduced renal function (Cl$_{cr}$ <50 mL/minute).

Dosing: Adjustment for Toxicity Manufacturer-recommended adjustments, listed according to indication:

Lymphoma (follicular):

Neutrophils >1000/mm^3 to <1500/mm^3: Reduce dose by 50%; may re-escalate to starting dose when neutrophils return to >1500/mm^3

Severe toxicity (neutrophils <1000/mm^3 or platelets <50,000/mm^3): Temporarily withhold

AST >5 times ULN or serum creatinine >2 mg/dL: Permanently discontinue

Hairy cell leukemia, chronic hepatitis C: Severe toxicity: Reduce dose by 50% or temporarily withhold and resume with 50% dose reduction; permanently discontinue if persistent or recurrent severe toxicity is noted

Chronic hepatitis B:

WBC <1500/mm^3, granulocytes <750/mm^3, or platelet count <50,000/mm^3, or other laboratory abnormality or severe adverse reaction: Reduce dose by 50%; may re-escalate to starting dose upon resolution of hematologic toxicity. Discontinue for persistent intolerance.

WBC <1000/mm^3, granulocytes <500/mm^3, or platelet count <25,000/mm^3: Permanently discontinue

Kaposi sarcoma: Severe toxicity: Reduce dose by 50% or temporarily withhold; may resume at reduced dose with toxicity resolution; permanently discontinue for persistent/recurrent toxicities

Malignant melanoma:

Severe toxicity (neutrophils >250/mm^3 to <500/mm^3 or ALT/AST >5-10 times ULN): Temporarily withhold; resume with a 50% dose reduction when adverse reaction abates

Neutrophils <250/mm^3, ALT/AST >10 times ULN, or severe/persistent adverse reactions: Permanently discontinue

Dosing: Combination Regimens

Head and neck cancer: PFL + IFN

Leukemia, acute lymphocytic: Hyper-CVAD (Leukemia, Acute Lymphocytic)

Lymphoma, non-Hodgkin's: Fludarabine-Mitoxantrone-Dexamethasone-Rituximab

Melanoma:

BOLD + Interferon

Cisplatin-Dacarbazine-Interferon Alfa-2b-Aldesleukin

CVD-Interleukin-Interferon (Melanoma)

Renal cell cancer:

Interleukin 2 (Low Dose)-Interferon Alfa 2b

Interleukin 2-Interferon Alfa-2

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Administer in evening (if possible)

Administration: I.V.Infuse over ~20 minutes

Administration: I.V. DetailpH: 6.9-7.5

Administration: OtherSubQ administration is suggested for those who are at risk for bleeding or are thrombocytopenic. Rotate SubQ injection site. Administer in evening (if possible). Patient should be well hydrated. Reconstitute with recommended amount of SWFI and agitate gently; do not shake. **Note:** Different vial strengths require different amounts of diluent. Not every dosage form is appropriate for every indication; refer to manufacturer's labeling.

StorageStore powder and solution for injection (vials and pens) under refrigeration at 2°C to 8°C (36°F to 46°F). Do not freeze.

Powder for injection: Following reconstitution, should be used immediately, but may be stored under refrigeration for up to 24 hours.

Prefilled pens: After first use, discard unused portion after 4 weeks.

ReconstitutionThe manufacturer recommends reconstituting vial with the diluent provided (SWFI). To prepare solution for infusion, further dilute appropriate dose in NS 100 mL. Final concentration should be ≥10 million units/100 mL.

CompatibilityStable in LR, NS; **incompatible** with D$_5$W.

RestrictionsAn FDA-approved medication guide is available at http://www.fda.gov/cder/Offices/ODS/labeling.htm; distribute to each patient to whom this medication is dispensed.

ContraindicationsHypersensitivity to interferon alfa or any component of the formulation; decompensated liver disease; autoimmune hepatitis

Warnings/Precautions

Boxed warnings:

- Autoimmune disease: See “Disease-related concerns” below.

- Infectious disorders: See "Disease-related concerns" below.

- Ischemic disorders: See "Disease-related concerns" below.

- Neuropsychiatric disorders: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Causes bone marrow suppression, including potentially severe cytopenias, and very rarely, aplastic anemia. Discontinue treatment for severe neutropenia (ANC <500/mm^3) or thrombocytopenia (platelets <25,000/mm^3). Hemolytic anemia (hemoglobin <10 g/dL) was observed in up to 10% of treated patients in clinical trials when combined with ribavirin; anemia occurred within 1-2 weeks of initiation of therapy. Use caution in patients with pre-existing myelosuppression and in patients with concomitant medications which cause myelosuppression.

- Cerebrovascular events: Hemorrhagic cerebrovascular events have been observed.

- Flu-like symptoms: Commonly associated with fever and flu-like symptoms; rule out other causes/infections with persistent fever. Use with caution in patients with debilitating conditions.

- Hepatic effects: May cause hepatotoxicity; monitor closely if abnormal liver function tests develop. A transient increase in ALT (≥2 times baseline) may occur in patients treated with interferon alfa-2b for chronic hepatitis B. Therapy generally may continue, however, functional indicators (eg, albumin, prothrombin time, bilirubin) should be monitored frequently. Worsening and potentially fatal liver disease, including jaundice, hepatic encephalopathy, and hepatic failure have been reported in patients receiving interferon alfa for chronic hepatitis B and C with decompensated liver disease, autoimmune hepatitis, history of autoimmune disease, and immunosuppressed transplant recipients; avoid interferon treatment (if appropriate) in these patients. Discontinue treatment in any patient developing signs or symptoms of liver failure.

- Hypersensitivity: Acute hypersensitivity reactions have been reported (rarely) with alfa interferons.

- Hypertriglyceridemia: Has been reported (discontinue if severe, particularly if combined with symptoms of pancreatitis).

- Neuropsychiatric disorders: **[U.S. Boxed Warning]: May cause severe psychiatric adverse events (eg, depression, psychosis, mania, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms;** avoid use in patients with pre-existing psychiatric condition, severe psychiatric disorder or history of severe depression; careful neuropsychiatric monitoring is required during and for 6 months after therapy. Suicidal ideation or attempts may occur more frequently in pediatric patients when compared to adults. Discontinue in patients developing severe depression or psychiatric disorders. Higher doses in elderly patients, or diseases other than hairy cell leukemia, may result in increased CNS toxicity.

- Ocular effects: Decreased/loss of vision, macular edema, optic neuritis, retinal hemorrhages, cotton wool spots, papilledema, and retinal artery or vein thrombosis have occurred (or been aggravated) in patients receiving alpha interferons. Use caution in patients with pre-existing eye disorders; monitor closely; discontinue with new or worsening ophthalmic disorders.

- Pulmonary effects: Pulmonary infiltrates, pneumonitis and pneumonia have been reported with interferon alfa therapy; occurs more frequently in patients being treated for chronic hepatitis C. Patients with fever, cough, dyspnea or other respiratory symptoms should be evaluated with a chest x-ray; monitor closely and consider discontinuing treatment with evidence of impaired pulmonary function. Use with caution in patients with a history of pulmonary disease.

Disease-related concerns:

- AIDS-related Kaposi's sarcoma: Do not treat patients with visceral AIDS-related Kaposi's sarcoma associated with rapidly-progressing or life-threatening disease.

- Autoimmune disease: **[U.S. Boxed Warning]: Avoid use in patients with history of autoimmune disorders;** development of autoimmune disorders (thrombocytopenia, vasculitis, Raynaud's disease, rheumatoid arthritis, lupus erythematosus and rhabdomyolysis) has been associated with alfa interferons. Monitor closely if autoimmune disease develops; consider discontinuing. Worsening of psoriasis and sarcoidosis (and the development of new sarcoidosis) have been reported; use caution in patients with these conditions.

- Cardiovascular disease: Use with caution and monitor closely in patients patients with cardiovascular disease (ischemic or thromboembolic), arrhythmias, hypertension, and in patients with a history of MI or prior therapy with cardiotoxic drugs. Patients with pre-existing cardiac disease and/or advanced cancer should have baseline and periodic ECGs. May cause hypotension (during administration or delayed), arrhythmia, tachycardia, cardiomyopathy (~2% in AIDS-related Kaposi's Sarcoma patients) and/or MI.

- Chronic hepatitis: Patients being treated for chronic hepatitis B or C with a history of autoimmune disease or who are immunosuppressed transplant recipients should not receive interferon alfa-2b.

- Coagulation disorders: Use with caution and monitor closely in patients with coagulation disorders.

- Diabetes: Has been reported; discontinue if diabetes cannot be effectively managed with medication. Use caution in patients with a history of diabetes mellitus, particularly if prone to DKA.

- Infectious disorders: **[U.S. Boxed Warning]: May cause or aggravate fatal or life-threatening infectious disorders;** discontinue treatment for persistent severe or worsening symptoms.

- Ischemic disorders: **[U.S. Boxed Warning]: May cause or aggravate fatal or life-threatening ischemic disorders;** discontinue treatment for persistent severe or worsening symptoms.

- Thyroid disorders: Use with caution in patients with pre-existing thyroid disease; thyroid disorders (hyper- or hypothyroidism) have been reported. Some have been irreversible upon discontinuation of treatment. Discontinue use in patients with thyroid disease who cannot maintain normal ranges with thyroid medication.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Dosage form specific issues:

- Albumin: Some formulations contain albumin, which may carry a remote risk of viral transmission, including a theoretical risk of Creutzfeldt-Jakob disease transmission.

- Product variability: **Due to differences in dosage, patients should not change brands of interferons without the concurrence of their healthcare provider.**

Pregnancy Risk FactorC / X in combination with ribavirin

Pregnancy ConsiderationsAnimal studies have demonstrated abortifacient effects. Disruption of the normal menstrual cycle was also observed in animal studies; therefore, the manufacturer recommends that reliable contraception is used in women of childbearing potential. Alfa interferon is endogenous to normal amniotic fluid. *In vitro* administration studies have reported that when administered to the mother, it does not cross the placenta. Case reports of use in pregnant women are limited. The Perinatal HIV Guidelines Working Group does not recommend that interferon-alfa be used during pregnancy. Interferon alfa-2b monotherapy should only be used in pregnancy when the potential benefit to the mother justifies the possible risk to the fetus. Combination therapy with ribavirin is contraindicated in pregnancy (refer to Ribavirin monograph); a pregnancy registry has been established for women inadvertently exposed to ribavirin while pregnant (800-593-2214).

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsBreast milk samples obtained from a lactating mother prior to and after administration of interferon alfa-2b showed that interferon alfa is present in breast milk and administration of the medication did not significantly affect endogenous levels. The AAP considers interferon alfa to be “usually compatible with breast-feeding.” Breast-feeding is not linked to the spread of hepatitis C virus; however, if nipples are cracked or bleeding, breast-feeding is not recommended. Mothers coinfected with HIV are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions**Note:** In a majority of patients, a flu-like syndrome (fever, chills, tachycardia, malaise, myalgia, headache), occurs within 1-2 hours of administration; may last up to 24 hours and may be dose limiting.

>10%:

Cardiovascular: Chest pain (≤28%)

Central nervous system: Fatigue (8% to 96%), fever (34% to 94%), headache (21% to 62%), chills (≤54%), depression (3% to 40%; grades 3/4: 2%), somnolence (≤33%), dizziness (≤24%), irritability (≤22%), pain (≤18%), amnesia (≤14%), concentration impaired (≤14%), malaise (≤14%), confusion (≤12%), insomnia (≤12%)

Dermatologic: Alopecia (≤38%), rash (≤25%), pruritus (≤11%)

Endocrine & metabolic: Amenorrhea (≤12%)

Gastrointestinal: Anorexia (1% to 69%), nausea, (17% to 66%), diarrhea (2% to 45%), vomiting (2% to 32%), xerostomia (≤28%), taste alteration (≤24%), abdominal pain (1% to 23%), constipation (≤14%), gingivitis (≤14%), weight loss (<1% to 13%)

Hematologic: Neutropenia (≤92%; grade 4: 1% to 4%), leukopenia (≤68%), anemia (≤32%), thrombocytopenia (≤15%)

Hepatic: AST increased (≤63%; grades 3/4: 14%), ALT increased (≤15%), pain (upper right quadrant: up to 15%); alkaline phosphatase increased (≤13%)

Local: Injection site reaction (≤20%)

Neuromuscular & skeletal: Myalgia (28% to 75%), weakness (≤63%), rigors (≤42%), paresthesia (1% to 21%), skeletal pain (≤21%), arthralgia (≤19%), back pain (≤19%)

Renal: BUN increased (≤12%)

Respiratory: Dyspnea (≤34%), cough (≤31%), pharyngitis (≤31%), sinusitis (≤21%)

Miscellaneous: Flu-like syndrome (≤79%), diaphoresis (1% to 21%), moniliasis (≤17%)

5% to 10%:

Cardiovascular: Edema (≤10%), hypertension (≤9%)

Central nervous system: Hypoesthesia (≤10%), anxiety (≤9%), vertigo (≤8%), agitation (≤7%)

Dermatologic: Dry skin (≤10%), dermatitis (≤8%), purpura (≤5%)

Endocrine & metabolic: Libido decreased (≤5%)

Gastrointestinal: Loose stools (≤10%), dyspepsia (≤8%)

Genitourinary: Urinary tract infection (≤5%)

Renal: Polyuria (≤10%), serum creatinine increased (≤6%)

Respiratory: Bronchitis (≤10%), nasal congestion (≤10%), epistaxis (≤7%)

Miscellaneous: Infection (≤7%), herpes virus infections (≤5%)

<5%, postmarketing, and/or case reports (limited to important or life-threatening):

Cardiovascular: Angina, arrhythmia, arteritis, atrial fibrillation, bradycardia, cardiac failure, cardiomegaly, cardiomyopathy, coronary artery disorder, ejection fraction decreased, extrasystoles, flushing, heart valve disorder, hypotension, MI, palpitation, peripheral ischemia, polyarteritis, Raynaud's disease, syncope, tachycardia, thrombosis, vasculitis

Central nervous system: Nervousness (≤3%), aggression, alcohol intolerance, aphasia, ataxia, Bell’s palsy, coma, extrapyramidal disorder, hallucination, hypothermia, mania, migraine, neurosis, paranoia, psychosis, stroke, suicidal attempt/ideation, seizure

Dermatologic: Angioedema, cellulitis, dermatitis lichenoides, eczema, epidermal necrolysis, erythema, erythema multiforme, erythematous rash, folliculitis, hirsutism, lipoma, maculopapular rash, photosensitivity, psoriasis, psoriasis exacerbation, sebaceous cyst, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Dehydration, diabetes mellitus, goiter, hot flashes, hypercalcemia, hyperglycemia, hyper-/hypothyroidism, hypertriglyceridemia, mastitis, menorrhagia, sexual dysfunction

Gastrointestinal: Colitis, dysphasia, esophagitis, gastritis, gastrointestinal hemorrhage, mucositis, pancreatitis, rectal bleeding/hemorrhage, stomatitis, ulcerative stomatitis

Genitourinary: Cystitis, dysuria, incontinence, impotence, leukorrhea, nocturia, pelvic pain, uterine bleeding

Hematologic: Aplastic anemia (rarely), granulocytopenia, hemolytic anemia, hypochromic anemia, lymphopenia, lymphadenitis, lymphadenopathy, lymphocytosis, pure red cell aplasia, thrombocytopenia purpura (idiopathic and thrombotic)

Hepatic: Ascites, biliary pain, bilirubinemia, hepatic encephalopathy, hepatic failure, hepatitis, hepatotoxicity, jaundice, lactate dehydrogenase increased (up to 1%), liver function test abnormal

Local: Injection site necrosis

Neuromuscular & skeletal: Arthritis, carpal tunnel syndrome, hyporeflexia, leg cramps, muscle atrophy, myositis, neuralgia, neuropathy, rhabdomyolysis, rheumatoid arthritis, spondylitis, tendonitis, tremor

Ocular: Blurred vision, conjunctivitis, cotton wool spots, macular edema, nystagmus, optic neuritis, papilledema, photophobia, retinal artery thrombosis, retinal vein thrombosis

Otic: Hearing impairment, hearing loss

Renal: Albuminuria, hematuria, nephrotic syndrome, proteinuria, renal failure, renal insufficiency

Respiratory: Asthma, bronchoconstriction, bronchospasm, cyanosis, hemoptysis, hypoventilation, pleural effusion, pneumonitis, pneumothorax, pulmonary embolism, pulmonary fibrosis, respiratory insufficiency, upper respiratory tract infection, wheezing

Miscellaneous: Abscess, acute hypersensitivity reaction, allergic reactions, anaphylaxis, fungal infection, lupus erythematosus, sarcoidosis, sarcoidosis exacerbation, sepsis

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak)

Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersBaseline chest x-ray, ECG; CBC with differential and platelets (baseline and routinely during treatment), liver function tests, serum creatinine, electrolytes, triglycerides, thyroid function tests (baseline and periodically during treatment); weight; ophthalmic exam (baseline and periodic, or with new ocular symptoms); patients with pre-existing cardiac abnormalities or in advanced stages of cancer should have ECGs taken before and during treatment

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests on a regular basis, therapeutic effectiveness, and adverse reactions. Patients with pre-existing cardiac abnormalities, or in advanced stages of cancer should have ECGs taken before and during treatment. Monitor for neuropsychiatric changes. Assess knowledge/instruct patient/caregiver on appropriate reconstitution, injection and needle disposal, possible side effects, and symptoms to report.

Monitoring: Lab TestsCBC with differential and platelets (baseline and routinely during treatment), liver function tests, serum creatinine, electrolytes, triglycerides, thyroid function tests (baseline and periodically during treatment)

Patient EducationUse as directed; do not change dosage or schedule of administration without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience flu-like syndrome (acetaminophen may help); nausea, vomiting, dry mouth, or metallic taste (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); fatigue, drowsiness, insomnia, dizziness, agitation, abnormal thinking (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Inform prescriber **immediately** if you feel depressed or have any thoughts of suicide. Report unusual bruising or bleeding; persistent abdominal disturbances; unusual fatigue; muscle pain or tremors; fever; chest pain or palpitation; swelling of extremities or unusual weight gain; respiratory difficulty; pain, swelling, or redness at injection site; decreased vision; or other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] =

Discontinued product

Injection, powder for reconstitution [preservative free]:

Intron® A: 10 million units; 18 million units; 50 million units [contains human albumin]

Injection, solution [multidose prefilled pen]:

Intron® A:

Delivers 3 million units/0.2 mL (1.5 mL) [delivers 6 doses; 18 million units; contains polysorbate 80; edetate disodium]

Delivers 5 million units/0.2 mL (1.5 mL) [delivers 6 doses; 30 million units; contains polysorbate 80; edetate disodium]

Delivers 10 million units/0.2 mL (1.5 mL) [delivers 6 doses; 60 million units; contains polysorbate 80; edetate disodium]

Injection, solution [multidose vial]:

Intron® A: 6 million units/mL (3 mL); 10 million units/mL (2.5 mL) [contains polysorbate 80; edetate disodium]

Injection, solution [single-dose vial]:

Intron® A: 10 million units/ mL (1 mL) [DSC] [contains polysorbate 80; edetate disodium]

See also Interferon Alfa-2b and Ribavirin Combination Pack monograph.

Generic AvailableNo

ManufacturerSchering-Plough Corp

Pricing: U.S. (www.drugstore.com)

Kit (Intron-A)

5000000 units/0.2 mL (1): $616.73

10000000 units/0.2 mL (1): $1008.58

Mechanism of ActionFollowing activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells

Pharmacodynamics/Kinetics

Distribution: V_d: 31 L; but has been noted to be much greater (370-720 L) in leukemia patients receiving continuous infusion IFN; IFN does not penetrate the CSF

Metabolism: Primarily renal

Bioavailability: I.M.: 83%; SubQ: 90%

Half-life elimination: I.V.: ~2 hours; I.M., SubQ: ~2-3 hours

Time to peak, serum: I.M., SubQ: ~3-12 hours

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), metallic taste, taste alteration, and gingivitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and drowsiness are common; may rarely cause delirium. Severe psychiatric disorders, including depression and suicidal behavior, have been associated with some interferons. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation and dry mouth

Anesthesia and Critical Care Concerns/Other ConsiderationsIndications and dosage regimens are specific for a particular brand of interferon; other brands have different indications and dosage guidelines.

Index TermsINF-alpha 2; Interferon Alpha-2b; NSC-377523; rLFN-α2; α-2-interferon

Medication Safety Issues

Sound-alike/look-alike issues:

Alferon® may be confused with Alkeran®

Pronunciation(in ter FEER on AL fa en three)

U.S. Brand NamesAlferon® N

Canadian Brand NamesAlferon® N

Pharmacologic CategoryInterferon

Use: Labeled IndicationsPatients ≥18 years of age: Intralesional treatment of refractory or recurring genital or venereal warts (condylomata acuminata)

Dosing: AdultsCondylomata acuminata: Intralesional: Inject 250,000 units (0.05 mL) in each wart twice weekly for a maximum of 8 weeks; therapy should not be repeated for at least 3 months after the initial 8-week course of therapy

Dosing: ElderlyRefer to adult dosing.

StorageStore solution at 2°C to 8°C (36°F to 46°F); do not freeze or shake solution.

ContraindicationsHypersensitivity to alpha interferon or any component of the formulation; anaphylactic sensitivity to mouse immunoglobulin, egg protein, or neomycin

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Flu-like symptoms: Flu-like symptoms are common; may aggravate debilitating conditions.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with severe myelosuppression.
- Cardiovascular disease: Use with caution in patients with pre-existing cardiac disease, including unstable angina, uncontrolled HF, or arrhythmias.
- Coagulation disorders: Use with caution in patients with coagulation disorders (such as thrombophlebitis, pulmonary embolism, hemophilia).
- Diabetes: Use with caution in patients with diabetes with ketoacidosis.
- Pulmonary disease: Use with caution in patients with severe pulmonary disease.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been not established in children.

Dosage form specific issues:

- Albumin: Contains albumin, which may carry a remote risk of transmitting Creutzfeldt-Jakob or other viral diseases.
- Product variability: **Due to differences in dosage, patients should not change brands of interferons.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsSafety and efficacy for use during pregnancy have not been established. Interferon alpha has been shown to decrease serum estradiol and progesterone levels in humans. Menstrual irregularities and abortion have been reported in animals. Effective contraception is recommended during treatment.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions**Note:** Adverse reaction incidence noted below is specific to intralesional administration in patients with condylomata acuminata. Flu-like reactions, consisting of headache, fever, and/or myalgia, were reported in 30% of patients, and abated with repeated dosing.

>10%:

Central nervous system: Fever (40%), headache (31%), chills (14%), fatigue (14%)

Hematologic: Decreased WBC (11%)

Neuromuscular & skeletal: Myalgia (45%)

Miscellaneous: Flu-like syndrome (30%)

1% to 10%:

Central nervous system: Malaise (9%), dizziness (9%), depression (2%), insomnia (2%), thirst (1%)

Dermatologic: Pruritus (2%)

Gastrointestinal: Nausea (45), vomiting (3%), dyspepsia (3%), diarrhea (2%), tongue hyperesthesia (1%), taste disturbance (1%)

Genitourinary: Groin lymph node swelling (1%)

Neuromuscular & skeletal: Arthralgia (5%), back pain (4%), cramps (1%), paresthesia (1%)

Ocular: Visual disturbance (1%)

Respiratory: Rhinitis (2%), pharyngitis (1%), nosebleed (1%)

Miscellaneous: Diaphoresis increased (2%), vasovagal reaction (2%)

<1%: Dysuria, hot flashes, impaired concentration, nervousness, photosensitivity. Rare adverse reactions reported with other alfa-interferons include depression, suicide, autoimmune disorders, ophthalmic disorders.

Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 5 million int. units (1 mL) [contains albumin]

Generic AvailableNo

Mechanism of ActionInterferons interact with cells through high affinity cell surface receptors. Following activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), metallic taste, tongue hyperesthesia, abnormal taste, thirst, rhinitis, pharyngitis, nosebleed, increased diaphoresis, taste disturbance, and gingivitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and drowsiness are common; may cause delirium or neurotoxicity. Severe psychiatric disorders, including depression and suicidal behavior, have been associated with some interferons. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation and dry mouth

Anesthesia and Critical Care Concerns/Other ConsiderationsIndications and dosage regimens are specific for a particular brand of interferon; other brands have different indications and dosage guidelines.

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Interferon alfacon-1 may be confused with interferon alfa-2a, interferon alfa-2b, interferon alfa-n3, peginterferon alfa-2b

International issues:

Interferon alfacon-1 may be confused with interferon alpha multi-subtype which is available in international markets

Pronunciation(in ter FEER on AL fa con one)

U.S. Brand NamesInfergen®

Pharmacologic CategoryInterferon

Use: Labeled IndicationsTreatment of chronic hepatitis C virus (HCV) infection in patients ≥18 years of age with compensated liver disease and anti-HCV serum antibodies or HCV RNA.

Dosing: AdultsChronic HCV infection: SubQ: 9 mcg 3 times/week for 24 weeks; allow 48 hours between doses.

Patients who have previously tolerated interferon therapy but did not respond or relapsed: SubQ: 15 mcg 3 times/week week for up to 48 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNot indicated for patients <18 years of age.

Dosing: Hepatic ImpairmentUse in decompensated hepatic disease is contraindicated.

Dosing: Adjustment for ToxicityDose should be held in patients who experience a severe adverse reaction, and treatment should be stopped or decreased if the reaction does not become tolerable.

Doses were reduced from 9 mcg to 7.5 mcg in the pivotal study.

For patients receiving 15 mcg/dose, doses were reduced in 3 mcg decrements. Efficacy is decreased with doses <7.5 mcg.

Administration: OtherInterferon alfacon-1 is given by SubQ injection, 3 times/week, with at least 48 hours between doses. Allow to reach room temperature just prior to administration.

StorageStore in refrigerator 2°C to 8°C (36°F to 46°F); do not freeze. Avoid exposure to direct sunlight. Do not shake vigorously.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to interferon alfacon-1 or any component of the formulation, other alpha interferons, or *E. coli*-derived products; decompensated liver disease; autoimmune hepatitis

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Boxed warnings:

- Autoimmune disease: See “Disease-related concerns” below.
- Infectious disorders: See “Disease-related concerns” below.
- Ischemic disorders: See “Disease-related concerns” below.
- Neuropsychiatric disorders: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Causes bone marrow suppression, including potentially severe cytopenias; discontinue for ANC <500/mm^{3}and platelets <50,000/mm^3. Use with caution in patients with low peripheral blood counts or myelosuppression, including concurrent use of myelosuppressive therapy.
- Cardiovascular events: Hypertension, palpitations, tachycardia, and tachyarrhythmias have been reported with interferon alfacon-1use.

Alfa interferon treatment has been associated with supraventricular arrhythmias, chest pain and MI. Use with caution in patients with pre-existing cardiac disease.

- Flu-like symptoms: Commonly associated with flu-like symptoms, including fever; rule out other causes/infection with persistent or high fever.

- Gastrointestinal effects: Gastrointestinal hemorrhage, ulcerative and hemorrhagic/ischemic colitis have been observed with interferon alfa treatment, including alfacon-1; may be severe and/or life-threatening; discontinue if symptoms (eg, abdominal pain, bloody diarrhea, and/or fever) develop.

- Hypersensitivity: Acute hypersensitivity reactions have been reported (rarely) with alfa interferons.

- Nephrotoxicity: Increases in serum creatinine and (rarely) renal failure have been reported with use; monitor closely for signs/symptoms of toxicity.

- Neuropsychiatric disorders: **[U.S. Boxed Warning]: May cause severe psychiatric adverse events (eg, depression, psychosis, mania, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms;** use with extreme caution in patients with a history of depression. Careful neuropsychiatric monitoring is required during therapy. Patients developing severe depression may require discontinuation of treatment. Although dose reduction or discontinuation may resolve symptoms, depression may persist; suicides have been reported after therapy with alfa interferons has been discontinued. Use with caution in patients with seizure disorders, brain metastases, or compromised CNS function.

- Ocular effects: Decreased/loss of vision, retinopathy (including macular edema), retinal artery or vein thrombosis, retinal hemorrhages, cotton wool spots, optic neuritis and papilledema have occurred in patients receiving other alpha interferons. Use caution in patients with pre-existing ophthalmic disorders; monitor closely and discontinue with new or worsening ophthalmic symptoms. Visual exams are recommended for patients with diabetes mellitus or hypertensive retinopathy.

- Pancreatitis: Has been observed (occasionally fatal); hypertriglyceridemia increases the risk for pancreatitis; discontinue treatment in patients with confirmed pancreatitis.

- Pulmonary effects: Dyspnea, pulmonary infiltrates, pneumonia, bronchiolitis obliterans, interstitial pneumonia, and sarcoidosis, resulting in potential fatal respiratory failure may occur with interferon alfa treatment, including interferon alfacon-1. Discontinue with unexplained pulmonary infiltrates or evidence of impaired pulmonary function. Use caution in patients with a history of pulmonary disease.

Disease-related concerns:

- Autoimmune disease: **[U.S. Boxed Warning]: Avoid use in patients with history of autoimmune disorders.** Development or exacerbation of autoimmune disorders (thrombocytopenic purpura, vasculitis, Raynaud’s disease, rheumatoid arthritis, interstitial nephritis, thyroiditis, lupus erythematosus, and rhabdomyolysis) has been associated with interferon alfa. Monitor closely and consider discontinuing if autoimmune disease develops. Use is contraindicated in patients with autoimmune hepatitis.

- Diabetes: Use with caution in patients with diabetes mellitus; hyperglycemia has been reported which may require adjustments in medications. Discontinue interferon alfacon-1 if unable to control blood sugars with medication during treatment.

- Hepatic impairment: Use with caution in patients with hepatic impairment; may be at risk for hepatic decompensation with alfa interferon therapy. Monitor closely; discontinue with signs (eg, jaundice, ascites, coagulopathy, hypoalbuminemia) of hepatic decompensation.

- Infectious disorders: **[U.S. Boxed Warning]: May cause or aggravate fatal or life-threatening infectious disorders;** discontinue treatment for persistent severe or worsening symptoms.

- Ischemic disorders: **[U.S. Boxed Warning]: May cause or aggravate fatal or life-threatening ischemic disorders;** discontinue treatment for persistent severe or worsening symptoms.

- Renal impairment: Use with caution in patients with renal impairment; interferon alfacon-1 has not been studied in these patients. Monitor closely.

- Thyroid disorders: Use with caution in patients with pre-existing thyroid disease; thyroid disorders (hyper- or hypothyroidism) have been reported. Discontinue interferon alfacon-1 if unable to control thyroid disorders with medication during treatment.

Special populations:

- Immunocompromised patients: Use with caution in chronically-immunosuppressed patients, including transplantation recipients.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Product variability: **Due to differences in dosage, patients should not change brands of interferons without the concurrence of their healthcare provider.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere have been no well-controlled studies in pregnant women. Animal studies have shown embryolethal or abortifacient effects. Males and females who are being treated with interferon alfacon-1 should use effective contraception.

LactationExcretion in breast milk unknown/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsWomen with hepatitis C should be instructed that there is a theoretical risk the virus may be transmitted in breast milk.

Adverse ReactionsAdverse reactions reported using 9 mcg/dose interferon alfacon-1 3 times/week. Flu-like symptoms (which included headache, fatigue, fever, myalgia, rigors, arthralgia, and increased diaphoresis) were the most commonly reported adverse reaction; this was reported separately from flu-like syndrome.

>10%:

Cardiovascular: Chest pain (13%)

Central nervous system: Headache (82%), fatigue (69%), fever (61%), insomnia (39%), nervousness (31%), depression (26%), dizziness (22%), anxiety (19%), emotional lability (12%), malaise (11%)

Dermatologic: Alopecia (14%), pruritus (14%), rash (13%)

Endocrine & metabolic: Hot flashes (13%)

Gastrointestinal: Abdominal pain (41%), nausea (40%), diarrhea (29%), anorexia (24%), dyspepsia (21%), vomiting (12%)

Hematologic: Granulocytopenia (23%), thrombocytopenia (3% to 19%), leukopenia (15%)

Local: Injection site erythema (23%)

Neuromuscular & skeletal: Myalgia (58%), rigors (57%), body pain (54%), arthralgia (51%), back pain (42%), limb pain (26%), neck pain (14%), skeletal pain (14%), paresthesia (13%)

Respiratory: Pharyngitis (34%), upper respiratory tract infection (31%), cough (22%), sinusitis (17%), rhinitis (13%), respiratory tract congestion (12%)

Miscellaneous: Flu-like syndrome (15%), diaphoresis increased (12%)

1% to 10%:

Cardiovascular: Peripheral edema (9%), hypertension (5%), tachycardia (4%), palpitation (3%)

Central nervous system: Amnesia (10%), hypoesthesia (10%), abnormal thinking (8%), agitation (6%), confusion (4%), somnolence (4%), apathy (2%), hyperesthesia (1%)

Dermatologic: Bruising (6%), erythema (6%), dry skin (6%), wound (4%)

Endocrine & metabolic: Thyroid test abnormalities (9%), dysmenorrhea (9%), triglycerides increased (6%), menstrual disorder (6%), decreased libido (5%), hypothyroidism (4%), menorrhagia (3%)

Gastrointestinal: Constipation (9%), flatulence (8%), toothache (7%), salivation decreased (6%), hemorrhoids (6%), weight loss (5%), taste perversion (3%), stomatitis (3%), gingivitis (2%)

Genitourinary: Vaginitis (8%), genital moniliasis (2%)

Hematologic: Anemia (1% to 2%)

Hepatic: Liver tenderness (5%), hepatomegaly (3%), prothrombin time increased (3%)

Local: Injection site pain (9%), access pain (8%), injection site bruising (6%)

Neuromuscular & skeletal: Weakness (9%), hypertonia (7%), musculoskeletal disorder (4%)

Ocular: Conjunctivitis (8%), eye pain (5%), vision abnormalities (3%)

Otic: Tinnitus (6%), earache (5%), otitis (2%)

Respiratory: Upper respiratory tract congestion (10%), epistaxis (8%), dyspnea (7%), bronchitis (6%)

Miscellaneous: Allergic reaction (7%), lymphadenopathy (6%), lymphocytosis (5%), infection (3%)

<1%, postmarketing, and/or case reports: Abdominal distension, abnormal gait, arthritis, ascites, ataxia, autoimmune disorders exacerbated, bone pain, cerebrovascular hemorrhage, cerebrovascular ischemia, creatinine increased, dehydration, delusion, diabetes, gastritis, gastrointestinal bleeding, hallucinations, hearing impairment, hearing loss, hemorrhage, hemorrhagic/ischemic colitis, hepatic encephalopathy, hepatic function abnormal, hyperbilirubinemia, hyperglycemia, hypersensitivity, injection site necrosis, injection site ulcer, jaundice, loss of consciousness, memory impairment, pancreatitis, pyoderma gangrenosum, renal failure, rhabdomyolysis, seizure, sepsis, speech disorder, tachyarrhythmias, toxic epidermal necrolysis, transaminases increased, tremor, visual field defect

Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring Parameters

Hemoglobin and hematocrit; white blood cell count; platelets; triglycerides; thyroid function. Laboratory tests should be taken prior to therapy, 2 weeks after therapy has begun, and periodically during treatment. HCV RNA, ALT to determine success/response to therapy.

The following guidelines were used during the clinical studies as acceptable baseline values:

Platelet count ≥75 x 10^9/L

Hemoglobin ≥100 g/L

ANC ≥1500 x 10^6/L

S_{cr} <180 µmol/L (<2 mg/dL) or Cl_{cr} >0.83 mL/second (>50 mL/minute)

Serum albumin ≥25 g/L

Bilirubin WNL

TSH and T_4 WNL

Patients should also be monitored for signs of depression. Patients with pre-existing diabetes mellitus or hypertensive retinopathy should have a baseline ophthalmic exam and periodic exams during therapy.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor for signs of depression and suicidal ideation. Assess results of laboratory tests on a regular basis during therapy. Patient with pre-existing diabetes mellitus or hypertension should have an ophthalmic exam prior to beginning treatment. Patient must be monitored closely for adverse reactions. If self-administered, instruct patient in appropriate storage, injection technique, and syringe disposal. Assess knowledge/teach patient purpose for use, adverse reactions and interventions, and adverse reactions to report.

Monitoring: Lab TestsHemoglobin and hematocrit, white blood cell count, platelets, triglycerides, and thyroid function. Laboratory tests should be taken prior to therapy, 2 weeks after therapy has begun, and periodically during treatment. HCV RNA, and ALT to determine success/response to therapy.

The following guidelines were used during the clinical studies as acceptable baseline values:

Platelet count ≥75 x 10^9/L

Hemoglobin ≥100 g/L

ANC ≥1500 x 10^6/L

S_{cr} <180 µmol/L (<2 mg/dL) or Cl_{cr} >0.83 mL/second (>50 mL/minute)

Serum albumin ≥25 g/L

Bilirubin WNL

TSH and T_4 WNL

Patient EducationUse exactly as directed (if self-administered, follow exact instructions for injection and syringe disposal). Do not alter dosage or brand of medication without consulting prescriber. You will need frequent laboratory tests during course of therapy. If you have diabetes or hypertension you should have ophthalmic exam prior to beginning therapy. You may experience headache, dizziness, nervousness, anxiety (use caution when driving or engaging in dangerous tasks until response to medication is known); nausea, vomiting, diarrhea, or loss of appetite (small frequent meals, frequent mouth care, sucking hard candy or chewing gum may help); flu-like symptoms such as headache, fatigue, muscle or joint pain, increased perspiration (mild non-narcotic analgesic may help); or hair loss (will probably grow back when treatment is completed). Promptly report any persistent GI upset; insomnia, depression, suicide ideation, anxiety, nervousness; chest pain or palpitations; muscle, bone, or joint pain; respiratory difficulties or congestion; abdominal pain; unusual bruising or bleeding; yellowing of skin; vision changes; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Infergen®: 30 mcg/mL (0.3 mL, 0.5 mL)

Generic AvailableNo

ManufacturerValeant Pharmaceuticals North America

Pricing: U.S. (www.drugstore.com)

Injection (Infergen)

15 mcg/0.5 mL (0.5): $122.62

Mechanism of ActionInterferon alfacon-1 is a member of the alpha interferon family of proteins, which are produced by nucleated cells, and have antiviral, antiproliferative, and immune-regulating activity. Interferons interact with cells through high affinity cell surface receptors. Following activation, multiple effects can be detected. Interferons induce gene transcription, inhibit cellular growth, alter the state of cellular differentiation, interfere with oncogene expression, alter cell surface antigen expression, increase phagocytic activity of macrophages, and augment cytotoxicity of lymphocytes for target cells. Although all alpha interferons share similar properties, the actual biological effects vary between subtypes.

Pharmacodynamics/KineticsPharmacokinetic studies have not been conducted on patients with chronic hepatitis C.

Time to peak: Healthy volunteers: 24-36 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusUse caution in those patients with depressive disorders. Severe psychiatric adverse effects, including depression, suicidal ideation, and suicide attempt may occur. Fatigue, insomnia, nervousness, depression, anxiety, and emotional lability are common.

Mental Health: Effects on Psychiatric TreatmentGranulocytopenia, thrombocytopenia, and leukopenia are common. Use caution with clozapine, carbamazepine, and valproate.

Anesthesia and Critical Care Concerns/Other ConsiderationsIndications and dosage regimens are specific for a particular brand of interferon; other brands have different indications and dosage guidelines.

Medication Safety Issues

Sound-alike/look-alike issues:

Avonex® may be confused with Avelox®

Pronunciation(in ter FEER on BAY ta won aye)

U.S. Brand NamesAvonex®; Rebif®

Canadian Brand NamesAvonex®; Rebif®

Pharmacologic CategoryInterferon

Use: Labeled IndicationsTreatment of relapsing forms of multiple sclerosis (MS)

Dosing: AdultsMultiple sclerosis: **Note:** Analgesics and/or antipyretics may help decrease flu-like symptoms on treatment days:

I.M. (Avonex®): 30 mcg once weekly

SubQ (Rebif®): Doses should be separated by at least 48 hours:

Target dose 44 mcg 3 times/week:

Initial: 8.8 mcg (20 % of final dose) 3 times/week for 2 weeks

Titration: 22 mcg (50% of final dose) 3 times/week for 2 weeks

Final dose: 44 mcg 3 times/week

Target dose 22 mcg 3 times/week:

Initial: 4.4 mcg (20 % of final dose) 3 times/week for 2 weeks

Titration: 11 mcg (50% of final dose) 3 times/week for 2 weeks

Final dose: 22 mcg 3 times/week

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentRebif®: If liver function tests increase or in case of leukopenia: Decrease dose 20% to 50% until toxicity resolves

Administration: I.M.Avonex®: Must be given by I.M. injection.

Administration: OtherRebif®: Administer SubQ at the same time of day on the same 3 days each week (ie, late afternoon/evening Mon, Wed, Fri). Rotate injection sites.

Storage

Avonex®:

Prefilled syringe: Store at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Allow to warm to room temperature prior to use (do not use external heat source). If refrigeration is not available, product may be stored at ≤25°C (77°F) for up to 7 days.

Vial: Store unreconstituted vial at 2°C to 8°C (36°F to 46°F). If refrigeration is not available, may be stored at 25°C (77°F) for up to 30 days; do not freeze. Protect from light. Following reconstitution, use immediately, but may be stored up to 6 hours at 2°C to 8°C (36°F to 46°F); do not freeze.

Rebif®: Store at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. May also be stored ≤25°C (77°F) for up to 30 days if protected from heat and light.

ReconstitutionAvonex®: Reconstitute with 1.1 mL of diluent and swirl gently to dissolve. Do not shake. The reconstituted product contains no preservative and is for single-use only; discard unused portion.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to natural or recombinant interferons, human albumin, or any other component of the formulation

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Allergic reactions, including anaphylaxis, have been reported.

- Autoimmune disorders: Autoimmune disorders including idiopathic thrombocytopenia, hyper- and hypothyroidism and rarely autoimmune hepatitis have been reported.

- Bone marrow suppression: Pancytopenia (rare) and thrombocytopenia have been reported; use with caution in patients with bone marrow suppression.

- Flu-like symptoms: Associated with a high incidence of flu-like adverse effects; use of analgesics and/or antipyretics on treatment days may be helpful.

- Hepatic effects: Rare cases of severe hepatic injury, including hepatic failure, have been reported in patients receiving interferon beta-1a; risk may be increased by ethanol use or concurrent therapy with hepatotoxic drugs. Treatment should be suspended if jaundice or symptoms of hepatic dysfunction occur. Some reports indicate symptoms began after 1-6 months of treatment. Transaminase elevations may be asymptomatic, so monitoring is important.

- Neuropsychiatric disorders: Interferons have been associated with severe psychiatric adverse events (psychosis, mania, depression, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms, avoid use in severe psychiatric disorders and use caution in patients with a history of depression; patients exhibiting symptoms of depression should be closely monitored and discontinuation of therapy should be considered.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with pre-existing cardiovascular disease, including angina, HF, and/or arrythmia. Rare cases of new-onset cardiomyopathy and/or HF have been reported.

- Hepatic impairment: Use with caution in patients with hepatic impairment or in those who abuse alcohol. Dosage adjustment may be necessary.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Chronic progressive MS: Safety and efficacy have not been established for this use.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Some formulations contain albumin, which may carry a remote risk of transmitting Creutzfeldt-Jakob or other viral diseases. Interferon beta-1a is contraindicated in albumin-sensitive patients.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Consideration should be given to discontinue treatment if a woman becomes pregnant, or plans to become pregnant during therapy. A dose-related abortifacient activity was reported in Rhesus monkeys.

Healthcare providers are encouraged to register pregnant women receiving Rebif® during pregnancy online at www.rebifpregnancyregistry.com or by telephone at MS LifeLines 1-877-44-REBIF. A registry has been established for women who become pregnant while receiving Avonex®. Women may be enrolled in the registry by calling 1-800-456-2255.

LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsPotential for serious adverse reactions. Because its use has not been evaluated during lactation, a decision should be made to either discontinue breast-feeding or discontinue the drug.
Adverse Reactions**Note:** Adverse reactions reported as a composite of both commercially-available products. Spectrum and incidence of reactions is generally similar between products, but consult individual product labels for specific incidence.

>10%:

Central nervous system: Headache (58% to 70%), fatigue (33% to 41%), fever (20% to 28%), pain (23%), chills (19%), depression (18% to 25%), dizziness (14%)

Gastrointestinal: Nausea (23%), abdominal pain (8% to 22%)

Genitourinary: Urinary tract infection (17%)

Hematologic: Leukopenia (28% to 36%)

Hepatic: ALT increased (20% to 27%), AST increased (10% to 17%)

Local: Injection site reaction (3% to 92%)

Neuromuscular & skeletal: Myalgia (25% to 29%), back pain (23% to 25%), weakness (24%), skeletal pain (10% to 15%), rigors (6% to 13%)

Ocular: Vision abnormal (7% to 13%)

Respiratory: Sinusitis (14%), upper respiratory tract infection (14%)

Miscellaneous: Flu-like syndrome (49% to 59%), neutralizing antibodies (significance not known; Avonex® 5%; Rebif® 24%), lymphadenopathy (11% to 12%)

1% to 10%:

Cardiovascular: Chest pain (5% to 6%), vasodilation (2%)

Central nervous system: Migraine (5%), somnolence (4% to 5%), malaise (4% to 5%), seizure (1% to 5%)

Dermatologic: Erythematous rash (5% to 7%), maculopapular rash (4% to 5%), alopecia (4%), urticaria

Endocrine & metabolic: Thyroid disorder (4% to 6%)

Gastrointestinal: Xerostomia (1% to 5%), toothache (3%)

Genitourinary: Micturition frequency (2% to 7%), urinary incontinence (2% to 4%)

Hematologic: Thrombocytopenia (2% to 8%), anemia (3% to 5%)

Hepatic: Bilirubinemia (2% to 3%)

Local: Injection site pain (8%), injection site bruising (6%), injection site necrosis (1% to 3%), injection site inflammation

Neuromuscular & skeletal: Arthralgia (9%), hypertonia (6% to 7%), coordination abnormal (4% to 5%)

Ocular: Eye disorder (4%), xerophthalmia (1% to 3%)

Respiratory: Bronchitis (8%)

Miscellaneous: Infection (7%)

<1%, postmarketing, and/or case reports: Anaphylaxis, autoimmune hepatitis, cardiomyopathy, CHF, hepatic failure, hepatitis, hyper-/hypothyroidism, idiopathic thrombocytopenia, injection site abscess/cellulitis, menorrhagia, metrorrhagia, pancytopenia, psychiatric disorders (new or worsening; including suicidal ideation), vesicular rash

Drug Interactions

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersThyroid function tests, CBC with differential, transaminase levels, symptoms of autoimmune disorders, signs/symptoms of psychiatric disorder (including depression and/or suicidal ideation), signs/symptoms of new onset/worsening cardiovascular disease

Avonex®: Frequency of monitoring for patients receiving Avonex® has not been specifically defined; in clinical trials, monitoring was at 6-month intervals.

Rebif®: CBC and liver function testing at 1-, 3-, and 6 months, then periodically thereafter. Thyroid function every 6 months (in patients with pre-existing abnormalities and/or clinical indications)

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests on a regular a basis, therapeutic effectiveness, and adverse reactions. Monitor for signs of depression and suicidal ideation. Assess knowledge/instruct patient/caregiver on appropriate reconstitution, injection and needle disposal, possible side effects, and symptoms to report.

Monitoring: Lab TestsThyroid function, transaminase levels, blood chemistries, CBC and differential, BUN, creatinine

Avonex®: Frequency of monitoring has not been specifically defined; in clinical trials, monitoring was at 6-month intervals.

Rebif®: CBC and liver function testing at 1-, 3-, and 6 months, then periodically thereafter; thyroid function every 6 months (in patients with pre-existing abnormalities and/or clinical indications)

Patient EducationThis is not a cure for MS; you will continue to receive regular treatment and follow-up for MS. Use as directed; do not change dosage or schedule of administration without consulting prescriber. If self-injecting and you miss a dose, take it as soon as you remember, but two injections should not be given within 48 hours of each other. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience flu-like syndrome (analgesics and/or antipyretics may help); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or drowsiness, sleep disturbances, dizziness, agitation, or abnormal thinking (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Inform prescriber **immediately** if you feel depressed or have any thoughts of suicide. Report unusual bruising or bleeding; persistent abdominal disturbances; unusual fatigue; muscle pain or tremors; chest pain or palpitations; shortness of breath; swelling of extremities; visual disturbances; pain, swelling, or redness at injection site; seizures; or other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Combination package [preservative free] (Rebif® Titration Pack):

Injection, solution: 8.8 mcg/0.2 mL (0.2 mL) [6 prefilled syringes; contains albumin]

Injection, solution: 22 mcg/0.5 mL (0.5 mL) [6 prefilled syringes; contains albumin]

Injection, powder for reconstitution (Avonex®): 33 mcg [6.6 million units; provides 30 mcg/mL following reconstitution] [contains albumin; packaged with SWFI, alcohol wipes, and access pin and needle]

Injection, solution (Avonex®): 30 mcg/0.5 mL (0.5 mL) [albumin free; prefilled syringe; syringe cap contains latex; packaged with alcohol wipes, gauze pad, and adhesive bandages]

Injection, solution [preservative free] (Rebif®): 22 mcg/0.5 mL (0.5 mL) [prefilled syringe; contains albumin]; 44 mcg/0.5 mL (0.5 mL) [prefilled syringe; contains albumin]

Generic AvailableNo

Mechanism of ActionInterferon beta differs from naturally occurring human protein by a single amino acid substitution and the lack of carbohydrate side chains; alters the expression and response to surface antigens and can enhance immune cell activities. Properties of interferon beta that modify biologic responses are mediated by cell surface receptor interactions; mechanism in the treatment of MS is unknown.

Pharmacodynamics/Kinetics

Onset of action: Avonex®: 12 hours (based on biological response markers)

Duration: Avonex®: 4 days (based on biological response markers)

Half-life elimination: Avonex®: 10 hours; Rebif®: 69 hours

Time to peak, serum: Avonex® (I.M.): 3-15 hours; Rebif® (SubQ): 16 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and toothache.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation, anxiety, agitation, or confusion. Severe psychiatric disorders, including depression and suicidal behavior, have been associated with the use of some interferons. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

Jump To Field (Select Field Name)

Pronunciation(in ter FEER on BAY ta won bee)
U.S. Brand NamesBetaseron®
Canadian Brand NamesBetaseron®
Pharmacologic CategoryInterferon
Use: Labeled IndicationsTreatment of relapsing forms of multiple sclerosis (MS); treatment of first clinical episode with MRI features consistent with MS
Dosing: Adults**Note:** Gradual dose-titration, analgesics, and/or antipyretics may help decrease flu-like symptoms on treatment days.

Multiple sclerosis (relapsing): SubQ: Initial: 0.0625 mg (2 million units; 0.25 mL) every other day; gradually increase dose by 0.0625 every 2 weeks

Target dose: 0.25 mg (8 million units; 1 mL) every other day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricNot recommended in children <18 years of age
Administration: OtherSubQ: Withdraw 1 mL of reconstituted solution from the vial into a sterile syringe fitted with a 27-gauge needle and inject the solution subcutaneously. Sites for self-injection include outer surface of the arms, abdomen, hips, and thighs. Rotate SubQ injection site. Patient should be well hydrated.
StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). If not used immediately following reconstitution, refrigerate solution at 2°C to 8°C (36°F to 46°F); do not freeze or shake solution.
ReconstitutionTo reconstitute solution, inject 1.2 mL of diluent (provided); gently swirl to dissolve, do not shake. Reconstituted solution provides 0.25 mg/mL (8 million units). Use product within 3 hours of reconstitution.
RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guide is available at http://www.berlex.com/html/products/pi/Betaseron_Medication_Guide.pdf.
ContraindicationsHypersensitivity to *E. coli*-derived products, natural or recombinant interferon beta, albumin human or any other component of the formulation
Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Has been reported rarely with use.
- Flu-like symptoms: Associated with a high incidence of flu-like adverse effects; use of analgesics and/or antipyretics on treatment days may be helpful.
- Hepatotoxicity: Has been reported with beta interferons, including rare reports of hepatitis (autoimmune) and hepatic failure requiring transplant; use with caution in patients with hepatic impairment.
- Infection: Increased risk of infection.
- Injection site reactions: Severe injection site reactions (necrosis) may occur, which may or may not heal with continued therapy; patient and/or caregiver competency in injection technique should be confirmed and periodically re-evaluated.
- Neuropsychiatric disorders: Interferons have been associated with severe psychiatric adverse events (psychosis, mania, depression, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms, avoid use in severe psychiatric disorders and use caution in patients with a history of depression; patients exhibiting symptoms of depression should be closely monitored and discontinuation of therapy should be considered.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression.
- Cardiovascular disease: Use with caution in patients with pre-existing cardiovascular disease.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Contains albumin, which may carry a remote risk of transmitting Creutzfeldt-Jakob or other viral diseases.

Geriatric ConsiderationsNo specific recommendations necessary for use in the elderly. Monitor for CNS adverse effects which may be significant in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsA dose-related abortifacient activity was reported in Rhesus monkeys. There are no adequate and well-controlled studies in pregnant women. Treatment should be discontinued if a woman becomes pregnant, or plans to become pregnant during therapy.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsBecause its use has not been evaluated during lactation, breast-feeding is not recommended
Adverse Reactions**Note:** Flu-like symptoms (including at least two of the following - headache, fever, chills, malaise, diaphoresis, and myalgia) are reported in the majority of patients (60%) and decrease over time (average duration ~1 week).

>10%:

Cardiovascular: Peripheral edema (15%), chest pain (11%)

Central nervous system: Headache (57%), fever (36%), pain (51%), chills (25%), dizziness (24%), insomnia (24%)

Dermatologic: Rash (24%), skin disorder (12%)

Endocrine & metabolic: Metrorrhagia (11%)

Gastrointestinal: Nausea (27%), diarrhea (19%), abdominal pain (19%), constipation (20%), dyspepsia (14%)

Genitourinary: Urinary urgency (13%)

Hematologic: Lymphopenia (88%), neutropenia (14%), leukopenia (14%)

Local: Injection site reaction (85%), inflammation (53%), pain (18%)

Neuromuscular & skeletal: Weakness (61%), myalgia (27%), hypertonia (50%), myasthenia (46%), arthralgia (31%), incoordination (21%)

Miscellaneous: Flu-like syndrome (decreases over treatment course; 60%)

1% to 10%:

Cardiovascular: Palpitation (4%), vasodilation (8%), hypertension (7%), tachycardia (4%), peripheral vascular disorder (6%)

Central nervous system: Anxiety (10%), malaise (8%), nervousness (7%)

Dermatologic: Alopecia (4%)

Endocrine & metabolic: Menorrhagia (8%), dysmenorrhea (7%)

Gastrointestinal: Weight gain (7%)

Genitourinary: Impotence (9%), pelvic pain (6%), cystitis (8%), urinary frequency (7%), prostatic disorder (3%)

Hematologic: Lymphadenopathy (8%)

Hepatic: ALT increased >5x baseline (10%), AST increased >5x baseline (3%)

Local: Injection site necrosis (4% to 5%), edema (3%), mass (2%)

Neuromuscular & skeletal: Leg cramps (4%)

Respiratory: Dyspnea (7%)

Miscellaneous: Diaphoresis (8%), hypersensitivity (3%)

<1% (Limited to important or life-threatening): Anaphylactoid reaction, anemia, apnea, arrhythmia, asthma, blindness, cardiac arrest, cardiomegaly, cardiomyopathy, cerebral hemorrhage, cholecystitis, coma, delirium, depression, diabetes mellitus, diabetes insipidus, erythema nodosum, esophagitis, ethanol intolerance, exfoliative dermatitis, gastrointestinal hemorrhage, hallucinations, heart failure, hematemesis, hepatitis, hepatomegaly, hypercalcemia, hyper-/hypoglycemia, hypothermia, hypothyroidism, manic reaction, MI, nephritic syndrome, pancreatitis, pericardial effusion, photosensitivity, psoriasis, psychosis, pulmonary embolism, rash (maculopapular and vesiculobullous), renal calculus, sepsis, shock, suicidal ideation, syncope, SIADH, thrombocytopenia, tremor, vaginal hemorrhage

Postmarketing and/or case reports: Anorexia, ataxia, bronchospasm, capillary leak syndrome (in patients with pre-existing monoclonal gammopathy), confusion, depersonalization, DVT, emotional lability, gamma GT increase, hepatic failure, hyperthyroidism, hyperuricemia, hypocalcemia, paresthesia, pneumonia, pruritus, seizure, skin discoloration, thyroid dysfunction, triglyceride increased, urinary tract infection, urosepsis, urticaria, vasculitis, vomiting, weight loss

Drug Interactions

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersComplete blood chemistries (including platelet count) and liver function tests are recommended at 1, 3, and 6 months following initiation of therapy and periodically thereafter. Thyroid function should be assessed every 6 months in patients with history of thyroid dysfunction.

Nursing: Physical Assessment/MonitoringMonitor laboratory results. Monitor closely for adverse reactions, especially patients with psychiatric or suicidal histories. Monitor injection sites for signs of necrosis. Assess patient/caregiver knowledge and teach proper administration for SubQ injections and disposal of needles if appropriate. Teach the need for adequate hydration. Monitor for opportunistic infection.

Monitoring: Lab TestsHemoglobin, liver function, blood chemistries

Patient EducationThis is not a cure for MS; you will continue to receive regular treatment and follow-up for MS. Use as directed; do not change dosage or schedule of administration without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience flu-like syndrome (acetaminophen may help); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea or constipation; or drowsiness, sleep disturbances, dizziness, agitation, headache, or abnormal thinking (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Inform prescriber **immediately** if you feel depressed or have any thoughts of suicide. Report any broken skin or black-blue discoloration around the injection site. Report unusual bruising or bleeding; persistent abdominal disturbances; unusual fatigue; muscle pain or tremors; chest pain or palpitations, swelling of extremities; visual disturbances; pain, swelling, or redness at injection site; or other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Betaseron®: 0.3 mg [9.6 million units] [contains albumin; packaged with prefilled syringe containing diluent]

Generic AvailableNo

ManufacturerBerlex Laboratories, Inc

Pricing: U.S. (www.drugstore.com)

Kit (Betaseron)

0.3 mg (14): $2217.72

Mechanism of ActionInterferon beta-1b differs from naturally occurring human protein by a single amino acid substitution and the lack of carbohydrate side chains; mechanism in the treatment of MS is unknown; however, immunomodulatory effects attributed to interferon beta-1b include enhancement of suppressor T cell activity, reduction of proinflammatory cytokines, down-regulation of antigen presentation, and reduced trafficking of lymphocytes into the central nervous system. Improves MRI lesions, decreases relapse rate, and disease severity in patients with secondary progressive MS.

Pharmacodynamics/KineticsLimited data due to small doses used

Half-life elimination: 8 minutes to 4.3 hours

Time to peak, serum: 1-8 hours

Pharmacotherapy PearlsAmerican Academy of Neurology and MS Council guidelines suggest that, based upon published data, 6 million units of Avonex® (interferon beta-1a) (30 mcg) is equivalent to approximately 7-9 million units of Betaseron® (220-280 mcg).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation, anxiety, agitation, or confusion. Severe psychiatric disorders, including depression and suicidal behavior, have been associated with use of some interferons. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

Anesthesia and Critical Care Concerns/Other ConsiderationsIndications and dosage regimens are specific for a particular brand of interferon; other brands have different indications and dosage guidelines.

Index TermsrIFN beta-1b

Pharmacologic CategoryInterferon

Use: Labeled IndicationsReduce frequency and severity of serious infections associated with chronic granulomatous disease; delay time to disease progression in patients with severe, malignant osteopetrosis

Dosing: AdultsIf severe reactions occur, modify dose (50% reduction) or therapy should be discontinued until adverse reactions abate.

Chronic granulomatous disease: SubQ:

BSA ≤0.5 m^2: 1.5 mcg/kg/dose 3 times/week

BSA >0.5 m^2: 50 mcg/m^2 (1 million int. units/m^2) 3 times/week

Note: Previously expressed as 1.5 million units/m^2; 50 mcg is equivalent to 1 million int. units/m^2.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Chronic granulomatous disease: Refer to adult dosing.

Severe, malignant osteopetrosis: SubQ:

BSA ≤0.5 m^2: 1.5 mcg/kg/dose 3 times/week

BSA >0.5 m^2: 50 mcg/m^2 (1 million int. units/m^2) 3 times/week

Dosing: Adjustment for ToxicityIf severe reactions occur, reduce dose by 50% or therapy should be interrupted until adverse reaction abates.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OtherAdminister by SubQ injection into the right and left deltoid or anterior thigh.

StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake. Discard if left unrefrigerated for >12 hours.

ContraindicationsHypersensitivity to interferon gamma, *E. coli* derived proteins, or any component of the formulation

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone marrow suppression: Dose-related bone marrow toxicity has been reported; use caution in patients with myelosuppression.
- CNS effects: The development of neurologic disorders have been noted at the higher doses; use with caution in patients with a history of seizure disorder or compromised CNS function.
- Flu-like symptoms: Have been noted at the higher doses and may exacerbate pre-existing cardiovascular disorders (including ischemia, HF, or arrhythmias).
- Hepatotoxicity: May cause hepatotoxicity and the incidence may be increased in children <1 year of age.
- Hypersensitivity reactions/rash: Hypersensitivity reactions have been reported (rarely). Transient cutaneous rashes may occur.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.

Other warnings/precautions:

- Investigational doses: Doses >10 times the weekly recommended dose (used in studies for unlabeled indications) have been associated with a different pattern/frequency of adverse effects.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. A dose-related abortifacient activity was reported in Rhesus monkeys. Safety and efficacy in pregnant women has not been established.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsPotential for serious adverse reactions. Because its use has not been evaluated during lactation, breast-feeding is not recommended

Adverse ReactionsBased on 50 mcg/m^2 dose administered 3 times weekly for chronic granulomatous disease

>10%:

Central nervous system: Fever (52%), headache (33%), chills (14%), fatigue (14%)

Dermatologic: Rash (17%)

Gastrointestinal: Diarrhea (14%), vomiting (13%)

Local: Injection site erythema or tenderness (14%)

1% to 10%:

Central nervous system: Depression (3%)

Gastrointestinal: Nausea (10%), abdominal pain (8%)

Neuromuscular & skeletal: Myalgia (6%), arthralgia (2%), back pain (2%)

Postmarketing and/or case reports: Alkaline phosphatase elevated, atopic dermatitis, granulomatous colitis, hepatomegaly, hypersensitivity reactions, hypokalemia, neutropenia, Stevens-Johnson syndrome

Additional adverse reactions noted at doses >100 mcg/m^2 administered 3 times weekly: ALT increased, AST increased, autoantibodies increased, bronchospasm, chest discomfort, confusion, dermatomyositis exacerbation, disorientation, DVT, gait disturbance, GI bleeding, hallucinations, heart block, heart failure, hepatic insufficiency, hyperglycemia, hypertriglyceridemia, hyponatremia, hypotension, interstitial pneumonitis, lupus-like syndrome, MI, neutropenia, pancreatitis (may be fatal), Parkinsonian symptoms, PE, proteinuria, renal insufficiency (reversible), seizure, syncope, tachyarrhythmia, tachypnea, thrombocytopenia, TIA

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2E1 (weak)

Drug Interactions

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersCBC with differential, platelets, LFTs (monthly in children <1 year), electrolytes, BUN, creatinine, and urinalysis prior to therapy and at 3-month intervals

Nursing: Physical Assessment/MonitoringMonitor closely for effectiveness and/or interactions. Assess results of laboratory tests on a regular basis, therapeutic effectiveness, and adverse reactions. Assess knowledge and instruct patient/caregiver on appropriate reconstitution, injection and needle disposal, possible side effects, and symptoms to report.

Monitoring: Lab TestsCBC with differential, platelets, LFTs (monthly in children <1 year), electrolytes, BUN, creatinine, and urinalysis prior to therapy and at 3-month intervals

Patient EducationUse as directed; do not change the dosage or schedule of administration without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience flu-like syndrome (acetaminophen may help); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or drowsiness, dizziness, agitation, or abnormal thinking (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report unusual bruising or bleeding; persistent abdominal disturbances; unusual fatigue; muscle pain or tremors; chest pain or palpitations; swelling of extremities; visual disturbances; pain, swelling, or redness at injection site; or other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Actimmune®: 100 mcg [2 million int. units] (0.5 mL)

Generic AvailableNo

Mechanism of ActionInterferon gamma participates in immunoregulation by enhancing the oxidative metabolism of macrophages; it also enhances antibody dependent cellular cytotoxicity, activates natural killer cells and has a role in the expression of Fc receptors and histocompatibility antigens. The exact mechanism of action for the treatment of chronic granulomatous disease or osteopetrosis has not been defined.

Pharmacodynamics/Kinetics

Absorption: I.M., SubQ: >89%

Half-life elimination: I.V.: 38 minutes; I.M.: ~3 hours, SubQ: ~6 hours

Time to peak, plasma: I.M.: 4 hours (1.5 ng/mL); SubQ: 7 hours (0.6 ng/mL)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Sedation is common; may rarely cause depression

Mental Health: Effects on Psychiatric Treatment May cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

Anesthesia and Critical Care Concerns/Other Considerations Indications and dosage regimens are specific for a particular brand of interferon; other brands have different indications and dosage guidelines.

60-62	9.6	355.2
64-66	9.8	362.6
68	9.9	366.3

Administration: I.V.Administer intravenously over 1-2 minutes. May flush with NS to ensure full delivery of dose. Prior to administration, a thyroid-protective agent should be started. Ensure adequate hydration before and after treatment.

Administration: I.V. DetailpH: 5-6.5

Dietary ConsiderationsSome dietary sources of iodine include cow's milk and dairy products, fish, seaweed, eggs, chocolate, and iodized salt.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Should be stored in original lead container or adequate radiation shield.

ContraindicationsHypersensitivity to iobenguane or any component of the formulation

Warnings/Precautions

Special handling:

- Radiopharmaceutical: Use appropriate precautions for handling, disposal, and minimizing exposure to patients and healthcare personnel. Use under supervision of experienced personnel.

Concerns related to adverse effects:

- Hypersensitivity reactions: Have been reported. Use extreme caution in patients with iodine or iodine-contrast agent hypersensitivity. Appropriate equipment and emergency medications should be available during use.

Disease-related concerns:

- Hypertension: Use with caution in patients with hypertension; may increase blood pressure and heart rate.

- Renal impairment: Use with caution in patients with severe renal impairment; safety and efficacy have not been established. Patients with severe renal impairment may have delayed elimination, therefore, decreasing quality of images. Not dialyzable.

Concurrent drug therapy issues:

- Norepinephrine uptake inhibitors: If possible, discontinue medications that inhibit norepinephrine uptake prior to iobenguane I 123 administration; allow at least 5 half-lives to elapse. These medications may interfere with the uptake of iobenguane I 123 in neuroendocrine tumors leading to false-negative results.

Special populations:

- Pediatrics: Safety and efficacy have not been established in infants <1 month of age.

Dosage form specific issues:

- Benzyl alcohol: Contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Appropriate use: Administer thyroid blocking medications (eg, potassium iodide oral solution, potassium perchlorate) at least 1 hour prior to administration; long-term risk for thyroid neoplasia can occur from failure to block thyroid uptake of iodine 123. Patients should be adequately hydrated prior to dosing; instruct patients to void frequently for 48 hours following administration to decrease radiation exposure.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Radiopharmaceuticals have the potential to cause fetal harm. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIodine 123 is excreted into human milk, therefore, due to potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended. May consider interrupting breast-feeding for 6 days after administration of iobenguane I 123 to minimize risk to infant.

Adverse Reactions<1%, postmarketing, and/or case reports: Dizziness, flushing, hypersensitivity (rare), injection site hemorrhage, pruritus, rash

Drug Interactions

Alpha2-Agonists: May diminish the therapeutic effect of Iobenguane I 123. **Exceptions:** Apraclonidine; Brimonidine. *Risk X: Avoid combination*

Antidepressants (Selective Norepinephrine Reuptake Inhibitor): May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Cocaine: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Methyldopa: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Reserpine: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Serotonin/Norepinephrine Reuptake Inhibitors: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Tricyclic Antidepressants: May diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Monitoring ParametersPulse and blood pressure prior to administration and intermittently for 30 minutes following; monitor for hypersensitivity reaction

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

AdreView™: Iobenguane sulfate 0.08 mg and I 123 74 MBq (2 mCi) per mL (5 mL) [contains benzyl alcohol]

Generic AvailableNo

ManufacturerGE Healthcare

Mechanism of ActionIobenguane is structurally similar to norepinephrine and therefore is taken up and stored in adrenergic tissue such as adrenal medulla, heart, liver, lungs, salivary glands, and spleen. Iobenguane is bound to radioactive iodine in order to obtain organ and tissue images.

Pharmacodynamics/Kinetics

Distribution: Increased in adrenergically innervated tissues (eg, heart, salivary glands, adrenal medulla)

Metabolism: Has not been characterized

Half-life elimination: Iodine 123: 13.2 hours

Excretion: Urine (70 % to 90%) within 4 days (normal renal function); feces <1%

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNorepinephrine reuptake inhibitors (most antidepressants and ziprasidone) may interfere with the uptake of iobenguane I 123 in neuroendocrine tumors leading to false-negative results. If possible taper/discontinue norepinephrine reuptake inhibitor and allow 5 half-lives to elapse prior to administration of iobenguane.

Index Terms123 Meta-Iodobenzlyguanidine Sulfate; 123I-Metaiodobenzylguanidine (MIBG); I-123 MIBG; I^{123} Iobenguane; Iobenguane Sulfate I 123

Dosing: Adults

Topical:

Cleaning wet ulcers and wounds (Iodosorb®, Iodoflex™): Apply to clean wound; maximum: 50 g/application and 150 g/week. Change dressing ~3 times/week; reduce applications as exudate decreases. Do not use for >3 months; discontinue when wound is free of exudate.

Antiseptic for minor cuts, scrapes, burns: Apply small amount to affected area 1- 3 times/day

RDA: Oral: 150 mcg/day

Pregnancy: 220 mcg/day

Breast-feeding: 290 mcg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**RDA:** Oral:

Children:

1-8 years: 90 mcg/day

9-13 years: 120 mcg/day

≥14 years: Refer to adult dosing

Administration: TopicalIodosorb®: Apply $^{1}/_{8}$" to $^{1}/_{4}$" thickness to dry sterile gauze, then place prepared gauze onto clean wound. Change dressing when gel changes color from brown to yellow/gray (~3 times/week). Remove with sterile water, saline, or wound cleanser; gently blot fluid from surface leaving wound slightly moist before reapplying gel.
Dietary ConsiderationsSome dietary sources of iodine include cow's milk and dairy products, fish, seaweed, eggs, chocolate and iodized salt.
ContraindicationsHypersensitivity to iodine or any component of the formulation

Iodosorb®, Iodoflex™: Hashimoto thyroiditis, history of Grave's disease, or nontoxic nodular goiter; pregnancy; breast-feeding

Warnings/Precautions

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Dosage form specific issues:

- Iodosorb®: For use as topical application to wet wounds only.

Other warnings/precautions:

- Appropriate use: Not for application to large areas of the body or for use with tight or air-excluding bandages.

- OTC labeling: When used for self-medication (OTC), do not use on deep wounds, puncture wounds, animal bites, or serious burns without consulting with healthcare provider. Notify healthcare provider if condition does not improve within 7 days.

Pregnancy ConsiderationsAn adequate amount of iodine intake is essential for thyroid function. Iodine crosses the placenta and requirements are increased during pregnancy. Iodine deficiency in pregnancy can lead to neurologic damage in the newborn; an extreme form, cretinism, is characterized by gross mental retardation, short stature, deaf mutism, and spasticity. Large amounts of iodine during pregnancy can cause fetal goiter or hyperthyroidism. Transient hypothyroidism in the newborn has also been reported following topical or vaginal use prior to delivery.

LactationEnters breast milk/use caution (AAP rates "compatible")

Breast-Feeding ConsiderationsIodine is excreted in breast milk and is a source of iodine for the nursing infant. Actual levels are variable, but have been reported as 113-270 mcg/L in American women. Application of topical iodine antiseptic solutions can be absorbed in amounts which may affect levels in breast milk. Exposure to excess iodine may cause thyrotoxicosis. Skin rash in the nursing infant has been reported with maternal intake of potassium iodide.

Adverse ReactionsReactions reported following topical application: Frequency not defined:

Endocrine & metabolic: TSH increased

Local: Eczema, edema, irritation, pain, redness

Miscellaneous: Allergic reaction

Reactions reported more likely observed following large doses or chronic iodine intoxication; frequency not defined:

Central nervous system: Fever, headache

Dermatologic: Skin rash, angioedema, urticaria, acne

Endocrine & metabolic: Hypothyroidism

Gastrointestinal: Metallic taste, diarrhea

Hematologic: Eosinophilia, hemorrhage (mucosal)

Neuromuscular & skeletal: Arthralgia

Ocular: Swelling of eyelids

Respiratory: Pulmonary edema

Miscellaneous: Ioderma, lymph node enlargement

Drug InteractionsThere are no known significant interactions.

Test InteractionsLarge amounts from excessive absorption may alter thyroid function tests.

Monitoring ParametersThyroid function should be monitored in pregnant women, neonates, and young infants if repeat applications over large areas are needed.

Monitoring: Lab TestsThyroid function should be monitored in pregnant women, neonates, and young infants if repeat applications over large areas are needed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Dressing, topical [gel pad] (Iodoflex™): 0.9% (5 g, 10 g)

Gel, topical (Iodosorb®): 0.9% (40 g)

Ointment, topical (Iodex): 4.7% (30 g, 720 g)

Tincture, topical: 2% (30 mL, 480 mL); 7% (30 mL, 480 mL)

Generic AvailableYes: Tincture

Mechanism of ActionIodine is required for thyroid hormone synthesis. Iodine is also known to be a powerful broad spectrum germicidal agent effective against a wide range of bacteria, viruses, fungi, protozoa, and spores. Iodosorb® and Iodoflex™ contain iodine in hydrophilic beads of cadexomer which allows a slow release of iodine into the wound and absorption of fluid, bacteria, and other substances from the wound

Pharmacodynamics/Kinetics

Absorption: Topical: Amount absorbed systemically depends upon concentration and characteristics of skin

Distribution: Primarily trapped by the thyroid

Bioavailability: Oral: >90%

Excretion: Urine (>90%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye oh DI pa mide MEG loo meen)

U.S. Brand NamesCholografin® Meglumine

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Ionic, High Osmolality)

Use: Labeled IndicationsContrast medium for intravenous cholangiography and cholecystography

Dosing: Adults**Note:** Do not repeat for 24 hours

Cholangiography and cholecystography: I.V.: 20 mL

Dosing: Pediatric**Note:** Do not repeat for 24 hours

Cholangiography and cholecystography: I.V.: Infants and Children: 0.3-0.6 mL/kg (maximum: 20 mL)

Administration: I.V.For intravenous use only; solution should be at body temperature for administration. Administer slowly over 10 minutes. Slow infusion if nausea or flushing occurs.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and excessive heat. If crystallization occurs, place vial in hot water and shake gently for several minutes until the solids redissolve. Allow solution to cool to body temperature before administering. Discard if cloudiness persists.

Compatibility

Y-site administration: Incompatible: Diphenhydramine

Compatibility when admixed: Incompatible: Diphenhydramine

ContraindicationsHypersensitivity to iodipamide salts or any component of the formulation; use in intrathecal procedures; concomitant severe renal and hepatic dysfunction

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Intrathecal use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Allergic reactions: Use extreme caution with history of previous reaction to contrast dye or iodine-based contrast media or asthma. Severe, potentially life-threatening, reactions and delayed reactions may occur. Pretreatment with corticosteroids (eg, prednisone) and antihistamines (eg, diphenhydramine) may be beneficial to decrease the frequency/severity of allergic reactions in “at risk” patients. Equipment for resuscitation and trained personnel experienced in handling emergencies should be immediately available. Monitor closely after injection.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild-to-moderate liver disease; visualization may not be achieved. Contraindicated in patients with severe hepatic impairment.

- Hypertension: Use with caution in patients with hypertension.

- Pheochromocytoma: Use with extreme caution in patients with pheochromocytoma; monitor blood pressure closely.

- Renal impairment: Nephrotoxicity has been associated with iodinated contrast agents; therefore, use caution in patients with severe renal impairment or in patients predisposed to contrast-induced nephrotoxicity (eg, diabetes, elderly, concomitant medications such as metformin).

- Sickle cell disease: Contrast agents may exacerbate sickling in sickle cell disease.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

Other warnings/precautions:

- Intrathecal: **[U.S. Boxed Warning]: Injectable solution should never be used intrathecally; serious adverse reactions have occurred,** including acute renal failure, cardiac arrest, cerebral hemorrhage, coma, death, paralysis, and seizures.

Pregnancy ConsiderationsReproduction studies have not been conducted. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac reactions (rare), cyanosis (rare), hypotension (rare)

Ocular: Edema of eyelids (rare)

Renal: Renal failure, renal function tests altered

Respiratory: Laryngospasm (rare), respiratory difficulties (rare)

Miscellaneous: Anaphylactoid reaction (rare); hypersensitivity reactions; infusion reactions (generally mild and transient; associated with rapid infusion rates; includes restlessness, sensations of warmth, sneezing, perspiration, salivation, flushing, pressure in the upper abdomen, dizziness, nausea, vomiting, chills, fever, headache, pallor, tremors)

Drug Interactions

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Cholografin® Meglumine: Iodipamide meglumine 520 mg/mL (20 mL) [provides organically-bound iodine 257 mg/mL; contains edetate disodium, sodium 0.91 mg (0.39 mEq)/mL]

Generic AvailableNo

ManufacturerBracco Diagnostics

Iodixanol

Lexi-Drugs Online

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Not for intrathecal use

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(EYE oh dix an ole)

U.S. Brand NamesVisipaque™

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Nonionic, Iso-Osmolality)

Use: Labeled Indications

Intra-arterial: Digital subtraction angiography, angiocardiography, peripheral arteriography, visceral arteriography, cerebral arteriography

Intravenous: Contrast enhanced computed tomography imaging, excretory urography, and peripheral venography

Dosing: Adults**Note:** Maximum recommended total dose of iodine: 80 g

Intra-arterial: Iodixanol 320 mg iodine/mL: Dose individualized based on injection site and study type; refer to product labeling

I.V.: Iodixanol 270 mg and 320 mg iodine /mL: concentration and dose vary based on study type; refer to product labeling.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Maximum recommended total dose of iodine: Not been established

Cerebral, cardiac chambers, and related major arteries and visceral studies: Intra-arterial: Children >1 year: Iodixanol 320 mg iodine/mL: 1-2 mL/kg; maximum dose: 4 mL/kg

Contrast-enhanced computer tomography or excretory urography: I.V.: Children >1 year: Iodixanol 270 mg iodine /mL: 1-2 mL/kg; maximum dose: 2 mL/kg

Children >12 years: Refer to adult dosing.

Dosing: Renal ImpairmentNot studied; use caution.

Administration: I.V.Patients should be adequately hydrated prior to and following administration.

Administration: I.V. DetailpH: 7-8

StorageStore in protective foil at room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Do not use if inadvertently frozen. Protect from light. Vials, glass and polymer bottles (**not** flexible containers) may be stored for up to 1 month at 37°C (98.6°F) in contrast agent warmer.

ContraindicationsHypersensitivity to iodixanol or any component of the formulation; not intended for intrathecal use

In pediatric population: Prolonged fasting or laxative administration prior to iodixanol administration

Refer to product labeling for procedure-specific contraindications.

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Administration: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylaxis: May cause serious and potentially fatal anaphylactoid reactions.
- Contrast dye/iodine hypersensitivity: Use with caution in patients with history of previous reaction to contrast dye or iodine.
- Delayed reactions: May cause delayed reaction; monitor patients for 30-60 minutes after injection.
- Thromboembolic events: Serious thromboembolic events have been reported during angiographic procedures with both ionic and nonionic contrast agents. Severe adverse events may occur during and for 30-60 minutes after administration.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment, especially those with concomitant renal dysfunction or when using both oral and IV contrast agents in close proximity.
- Multiple myeloma: Use with caution in patients with multiple myeloma; may worsen renal insufficiency.
- Pheochromocytoma: Use with extreme caution in patients with known or suspected pheochromocytoma. Dose injected should be kept to a minimum to minimize exposure; monitor blood pressure closely.
- Renal impairment: Use with caution in patients with renal impairment; clearance is reduced.
- Sickle cell disease: Use with caution in patients with sickle cell disease; may promote sickling.
- Thyroid dysfunction: Use with caution in patients with thyroid disease; thyroid storm has been reported in patients with history of hyperthyroidism.

Special populations:

- Elderly: Use with caution in elderly patients with age-related renal impairment.
- Pediatrics: Children may have an increased risk of adverse effects, especially patients with asthma, sensitivity to allergens or medications, heart disease, or renal dysfunction.

Other warnings/precautions:

- Administration: For I.V. or intra-arterial use only. **[U.S. Boxed Warning]: May be fatal if given intrathecally.** Avoid extravasation, especially in patients with severe arterial or venous disease.
- *In vitro* clotting: Clotting has been reported when blood remains in contact with syringes containing ioxilan; use of plastic syringes in place of glass syringes has been reported to decrease, but not eliminate, the likelihood of *in vitro* clotting.

Pregnancy Risk FactorB

Pregnancy ConsiderationsFetal harm was not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reactions, temporary discontinuation of breast-feeding should be considered.

Adverse Reactions

>10%: Local: Injection site reactions (discomfort/pain/warmth 30%)

1% to 10%:

Cardiovascular: Angina/chest pain (2%)

Central nervous system: Headache/migraine (3%), vertigo (2%)

Dermatologic: Nonurticarial rash/erythema (2%), pruritus (2%)

Gastrointestinal: Taste perversion (4%), nausea (3%)

Neuromuscular & skeletal: Paresthesia (1%)

Respiratory: Parosoma (1%)

<1%: Abnormal renal function, abnormal vision, acute renal failure, agitation, amnesia, anxiety, apnea (children only), arrhythmia (children only), asthma, AV block (children only), back pain, bronchitis, bundle branch block (children only), cardiac arrest, cardiac failure (children only), cerebral vascular disorder, confusion, diaphoresis, diarrhea, disseminated intravascular coagulation (children only), dizziness, dyspepsia, dyspnea, edema, fatigue, fever (children only), flushing, hematoma, hematuria, hemorrhage, hypersensitivity, hypertension, hypoesthesia, hypotensive collapse, insomnia, malaise, nervousness, peripheral ischemia, pharyngeal edema, pulmonary edema, rhinitis, scotoma, seizure, sensory disturbance, shock, stupor, syncope, tinnitus, urticaria, vomiting

Postmarketing and/or case reports: Anaphylactoid reaction, anaphylaxis, cortical blindness, dyskinesia, hypoglycemia, polymyalgia, pulmonary embolism, respiratory depression

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Test InteractionsThyroid function tests (protein bound and radioactive iodine uptake studies) may be inaccurate for up to 16 days after administration; may cause false positive urine protein test using Multistix®; may affect urine specific gravity

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Visipaque™ 270: 550 mg/mL (50 mL, 100 mL, 125 mL, 150 mL, 200 mL) [provides organically-bound iodine 270 mg/mL; contains tromethamine 1.2 mg/mL, edetate calcium disodium]

Visipaque™ 320: 652 mg/mL (50 mL, 100 mL, 125 mL, 150 mL, 200 mL) [provides organically-bound iodine 320 mg/mL; contains tromethamine 1.2 mg/mL, edetate calcium disodium]

Generic Available No

ManufacturerAmersham Health

Mechanism of Action Opacifies vessels in the path of flow permitting radiographic imaging of internal structures.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.26 L/kg

Protein binding: No

Half-life elimination: Children: 2-4 hours; Adults: 2 hours

Time to peak, plasma: Immediate; peak enhancement at 15-120 seconds; optimum renal contrast at 5-15 minutes; brain contrast at up to 1 hour

Excretion: Urine (97% within 24 hours); feces (<2%)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause serious thromboembolic events including stroke

Mental Health: Effects on Psychiatric Treatment None reported

Medication Safety Issues

Sound-alike/look-alike issues:

Vytone® may be confused with Hytone®, Zydone®

Pronunciation(eye oh doe KWIN ole & hye droe KOR ti sone)
U.S. Brand NamesAlcortin™; Dermazene®; Vytone®
Pharmacologic CategoryAntifungal Agent, Topical; Corticosteroid, Topical
Use: Labeled IndicationsTreatment of eczema (including impetiginized, nuchal, and nummular); acne urticaria; anogenital pruritus, atopic dermatitis, chronic infectious dermatitis; chronic eczematoid otitis externa; folliculitis, intertrigo; lichen simplex chronicus; moniliasis; mycotic dermatoses; neurodermatitis (localized or systemic); pyoderma, stasis dermatitis
Use: DentalReported to be useful in the treatment of angular cheilitis
Dosing: AdultsDermatoses: Topical: Apply 3-4 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥12 years: Topical: Refer to adult dosing.
StorageStore at 15°C to 30°C (59°C to 86°C). Keep tightly closed.
Contraindications

Based on **iodoquinol** component: Hypersensitivity to iodine or iodoquinol or any component of the formulation; hepatic damage; pre-existing optic neuropathy

Based on **hydrocortisone** component: Hypersensitivity to hydrocortisone or any component of the formulation; serious infections, except septic shock or tuberculous meningitis; viral, fungal, or tubercular skin lesions

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Optic atrophy/neuritis: Following prolonged use of iodoquinol, optic neuritis and optic atrophy have occurred; avoid long-term therapy.

- Peripheral neuropathy: Following prolonged use of iodoquinol, peripheral neuropathy has occurred; avoid long-term therapy.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Thyroid disease: Use with caution in patients with thyroid abnormalities.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

Based on **iodoquinol** component:

Central nervous system: Fever, chills, agitation, retrograde amnesia, headache

Dermatologic: Rash, urticaria, pruritus

Endocrine & metabolic: Thyroid gland enlargement

Gastrointestinal: Diarrhea, nausea, vomiting, stomach pain, abdominal cramps

Neuromuscular & skeletal: Peripheral neuropathy, weakness

Ocular: Optic neuritis, optic atrophy, visual impairment

Miscellaneous: Itching of rectal area

Based on **hydrocortisone** component:

>10%:

Central nervous system: Insomnia, nervousness

Gastrointestinal: Increased appetite, indigestion

1% to 10%:

Dermatologic: Hirsutism

Endocrine & metabolic: Diabetes mellitus

Neuromuscular & skeletal: Arthralgia

Ocular: Cataracts

Respiratory: Epistaxis

<1%: Hypertension, edema, euphoria, headache, delirium, hallucinations, seizure, mood swings, acne, dermatitis, skin atrophy, bruising, hyperpigmentation, hypokalemia, hyperglycemia, Cushing's syndrome, sodium and water retention, bone growth suppression, amenorrhea, peptic ulcer, abdominal distention, ulcerative esophagitis, pancreatitis, muscle wasting, hypersensitivity reactions, immunosuppression

Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Jump To Field (Select Field Name)

Pronunciation(eye oh doe KWIN ole)
U.S. Brand NamesYodoxin®
Canadian Brand NamesDiodoquin®
Pharmacologic CategoryAmebicide
Use: Labeled IndicationsTreatment of acute and chronic intestinal amebiasis; asymptomatic cyst passers; *Blastocystis hominis* infections; ineffective for amebic hepatitis or hepatic abscess
Dosing: AdultsTreatment of susceptible infections: Oral: 650 mg 3 times/day after meals for 20 days; not to exceed 2 g/day
Dosing: ElderlyThis agent is no longer a drug of choice; use only if other therapy is contraindicated or has failed. Due to optic nerve damage, use cautiously in the elderly.
Dosing: PediatricTreatment of susceptible infections: Oral: Children: 30-40 mg/kg/day (maximum: 650 mg/dose) in 3 divided doses for 20 days; not to exceed 1.95 g/day
Administration: OralTablets may be crushed and mixed with applesauce or chocolate syrup. May take with food or milk to reduce stomach upset. Complete full course of therapy.
Dietary ConsiderationsShould be taken after meals.
ContraindicationsHypersensitivity to iodine or iodoquinol or any component of the formulation; hepatic damage; pre-existing optic neuropathy
Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: May occur.
- Optic atrophy/neuritis: Following prolonged use, optic neuritis and optic atrophy have occurred; avoid long-term therapy.

Disease-related concerns:

- Thyroid disease: Use with caution in patients with thyroid abnormalities.

Geriatric ConsiderationsNo special considerations for the elderly, however, this agent is no longer a drug of choice. Use only if other therapy is contraindicated or has failed. Due to optic nerve damage, use cautiously in the elderly.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Central nervous system: Fever, chills, agitation, retrograde amnesia, headache

Dermatologic: Rash, urticaria, pruritus

Endocrine & metabolic: Thyroid gland enlargement

Gastrointestinal: Diarrhea, nausea, vomiting, stomach pain, abdominal cramps

Neuromuscular & skeletal: Peripheral neuropathy, weakness

Ocular: Optic neuritis, optic atrophy, visual impairment

Miscellaneous: Itching of rectal area

Drug InteractionsThere are no known significant interactions.
Test InteractionsMay increase protein-bound serum iodine concentrations reflecting a decrease in ^{131}I uptake; false-positive ferric chloride test for phenylketonuria
Monitoring ParametersOphthalmologic exam
Nursing: Physical Assessment/MonitoringCheck allergy history (iodine) prior to beginning therapy. Perform ophthalmological exams with long-term therapy. Teach patient appropriate use, reinfection prevention, possible side effects/interventions, and adverse symptoms to report.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; complete full course of therapy. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals may help). You may experience GI upset (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report unresolved or severe nausea or vomiting, skin rash, fever, or fatigue. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 210 mg, 650 mg

Generic AvailableNo

Mechanism of ActionContact amebicide that works in the lumen of the intestine by an unknown mechanism

Pharmacodynamics/Kinetics

Absorption: Poor and erratic

Metabolism: Hepatic

Excretion: Feces (high percentage)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation or amnesia

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsDiiodohydroxyquin

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye oh HEX ole)
U.S. Brand NamesOmnipaque™
Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Nonionic, Low Osmolality)
Use: Labeled Indications

Intrathecal: Myelography; contrast enhancement for computerized tomography

Intravascular: Angiocardiography, aortography, digital subtraction angiography, peripheral arteriography, excretory urography; contrast enhancement for computed tomographic imaging

Oral/body cavity: Arthrography, GI tract examination, hysterosalpingography, pancreatography, cholangiopancreatography, herniography, cystourethrography; enhanced computed tomography of the abdomen

StorageSolution for injection: Store at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.
ContraindicationsHypersensitivity to iohexol or any component of the formulation

Refer to product labeling for procedure-specific contraindications

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Pregnancy Risk FactorB
Pregnancy ConsiderationsFetal harm was not observed in animal studies. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsBottle feedings are recommended for 24 hours after administration.
Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, injection [preservative free]:

140: 302 mg/mL (50 mL) [provides organic iodine 140 mg/mL; contains tromethamine 1.21 mg/mL, edetate calcium disodium]

180: 388 mg/mL (10 mL, 20 mL) [provides organic iodine 180 mg/mL; contains tromethamine 1.21 mg/mL, edetate calcium disodium]

240: 518 mg/mL (10 mL, 20 mL, 100 mL, 150 mL, 200 mL) [provides organic iodine 240 mg/mL; contains tromethamine 1.21 mg/mL, edetate calcium disodium]

300: 647 mg/mL (10 mL, 30 mL, 50 mL, 75 mL, 100 mL, 125 mL, 150 mL, 200 mL) [provides organic iodine 300 mg/mL; contains tromethamine 1.21 mg/mL, edetate calcium disodium]

350: 755 mg/mL (50 mL, 75 mL, 100 mL, 125 mL, 150 mL, 200 mL, 250 mL) [provides organic iodine 350 mg/mL; contains tromethamine 1.21 mg/mL, edetate calcium disodium]

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye oh PA mi dole)

U.S. Brand NamesIsovue Multipack®; Isovue-M®; Isovue®

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Nonionic, Low Osmolality)

Use: Labeled Indications

Intrathecal (Isovue-M®): Neuroradiology; contrast enhancement of computed tomographic cisternography and ventriculography; thoraco-lumbar myelography

Intravascular (Isovue®, Isovue Multipack®): Angiography, excretory urography; contrast enhancement of computed tomographic imaging; evaluation of certain malignancies; image enhancement of non-neoplastic lesions

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to iopamidol or any component of the formulation

Refer to product labeling for product- and procedure-specific contraindications

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Pregnancy Risk FactorB

Pregnancy ConsiderationsFetal harm was not observed in animal studies. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

LactationExcretion in breast milk unknown/use caution

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Isovue®:

200: 41% (50 mL, 200 mL) [provides organically-bound iodine 200 mg/mL; contains sodium 0.029 mg (0.001 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

250: 51% (50 mL, 100 mL, 150 mL) [provides organically-bound iodine 250 mg/mL; contains sodium 0.036 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

300: 61% (30 mL, 50 mL, 75 mL, 100 mL, 125 mL, 150 mL, 175 mL) [provides organically-bound iodine 300 mg/mL; contains sodium 0.043 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

370: 76% (20 mL, 30 mL, 50 mL, 75 mL, 100 mL, 125 mL, 150 mL, 200 mL) [provides organically-bound iodine 370 mg/mL; contains sodium 0.053 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

Isovue-M®:

200: 41% (10 mL, 20 mL) [provides organically-bound iodine 200 mg/mL; contains sodium 0.029 mg (0.001 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

300: 61% (15 mL) [provides organically-bound iodine 300 mg/mL; contains sodium 0.043 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

Isovue Multipack® [pharmacy bulk package]:

250: 51% (200 mL) [provides organically-bound iodine 250 mg/mL; contains sodium 0.036 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

300: 61% (200 mL, 500 mL) [provides organically-bound iodine 300 mg/mL; contains sodium 0.043 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

370: 76% (200 mL, 500 mL) [provides organically-bound iodine 370 mg/mL; contains sodium 0.053 mg (0.002 mEq)/mL, tromethamine 1 mg/mL, edetate calcium disodium]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye oh PROE mide)

U.S. Brand NamesUltravist®

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Nonionic, Low Osmolality)

Use: Labeled IndicationsEnhance imaging in cerebral arteriography and peripheral arteriography; coronary arteriography and left ventriculography, visceral angiography and aortography; contrast-enhanced computed tomographic imaging of the head and body, excretory urography, intra-arterial digital subtraction angiography, peripheral venography

Dosing: Adults**Note:** Maximum recommended total dose of iodine is 86 g. Individualize dose based upon patient's age, body weight, size of the vessel, and the rate of blood flow within the vessel.

Aortography and visceral angiography: Intravascular (370 mg iodine/mL): Volume and rate of administration based on blood flow and specific characteristics of vessels being studied; maximum dose for procedure: 225 mL

Cerebral arteriography: Intravascular (300 mg iodine/mL): Maximum dose for procedure: 150 mL

Carotid artery visualization: 3-12 mL

Vertebral artery visualization: 4-12 mL

Aortic arch injection: 20-50 mL

Coronary arteriography and left ventriculography: Intravascular (370 mg iodine/mL): Maximum dose for procedure: 225 mL

Left coronary: 3-14 mL

Right coronary: 3-14 mL

Left ventricle: 30-60 mL

Intra-arterial digital subtraction angiography: Intravascular (150 mg iodine/mL): Maximum dose for procedure: 250 mL

Carotid arteries: 6-10 mL

Vertebral: 4-8 mL

Aorta: 20-50 mL

Major branches of the abdominal aorta: 2-20 mL

Peripheral arteriography: Intravascular (300 mg iodine/mL): Maximum dose for procedure: 250 mL. **Note:** The artery needs a pulse to be injected.

Subclavian or femoral artery: 5-40 mL

Aortic bifurcation for distal runoff 25-50 mL

Contrast-enhanced CT: I.V. (300 mg iodine/mL):

Head: 50-200 mL; maximum dose for procedure: 200 mL

Body: 50-200 mL (usual dose for infusion is 100-200 mL); **Note:** Can be given by bolus injection, by rapid infusion, or both; maximum dose for procedure: 200 mL

Excretory urography (normal renal function): I.V. (300 mg iodine/mL): 1 mL/kg; maximum dose for procedure: 100 mL

Peripheral venography: I.V. (240 mg iodine/mL): Minimum amount to clearly visualize the structure under examination; maximum dose for procedure: 250 mL

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Cardiac chambers and related arteries: Children >2 years: I.V. (370 mg iodine/mL): 1-2 mL/kg; maximum dose for procedure: 4 mL/kg

Contrast-enhanced CT: Children >2 years: I.V. (300 mg iodine/mL): 1-2 mL/kg; maximum dose for procedure: 3 mL/kg

Administration: OtherSolutions for intra-arterial injections should be as close to body temperature as possible. Injection rates should be about equal to the flow rate in the vessel being injected. Allow sufficient time between each large injection. Visually inspect prior to use; do not use if discolored, if particulate matter is present, or if containers are defective.

StorageStore at 25°C (77°F). Protect from light.

CompatibilityShould not be mixed with or injected into any lines containing other drugs or solutions.

ContraindicationsNot indicated for intrathecal use

Pediatrics: Prolonged fasting and laxative use prior to administration of iopromide

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Administration: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Anaphylaxis: May cause serious and potentially fatal anaphylactoid reactions
- Blood-brain barrier disruption: In patients with known or suspected blood brain barrier disruption or with normal blood-brain barriers and renal failure, iodinated contrast agents have been associated with blood-brain barrier disruption and accumulation of contrast in the brain; use with caution.
- Contrast media nephropathy: Contrast agents may cause acute renal impairment defined as a serum creatinine rise of 0.5 mg/dL or increase of 50% over baseline. Risk factors include concurrent use of nephrotoxic agents, dehydration, diabetes, heart failure, high-dose contrast, and pre-existing renal impairment. In patients at risk, minimize dose and monitor renal function.
- Delayed reactions: May cause delayed adverse reactions; monitor patients for 30-60 minutes after injection.
- Immune reaction: Risks for an immune reaction include previous reaction to contrast, known sensitivity to iodine and known allergies (asthma, hay fever and food allergies), other hypersensitivities, and underlying immune disorder. Skin testing cannot be relied upon and may be dangerous. Treatment for severe reactions should be immediately available.
- Thromboembolic events: Serious thromboembolic events have been reported during angiographic procedures with both ionic and nonionic contrast agents.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Diabetes: Use with caution in patients with diabetes mellitus; these patients may have altered renal blood flow, increasing risk of nephrotoxicity.
- Hepatic impairment: Use with caution in patients with hepatic impairment, especially those with concomitant renal dysfunction or when using both oral and I.V. contrast agents in close proximity.
- Multiple myeloma: Use with caution in patients with multiple myeloma; may worsen renal insufficiency.
- Pheochromocytoma: Use with extreme caution in patients with known or suspected pheochromocytoma. Dose injected should be kept to a minimum to minimize exposure; monitor blood pressure closely.
- Renal impairment: Use with caution in patients with renal impairment; clearance is reduced.
- Sickle cell disease: Use with caution in patients with sickle cell disease; may promote sickling.
- Thyroid dysfunction: Use with caution in patients with thyroid disease; thyroid storm has been reported in patients with history of hyperthyroidism.

Concurrent drug therapy issues:

- General anesthesia: Use with caution in patients undergoing general anesthesia while receiving contrast agents; may be an increased risk of adverse events.

Special populations:

- Elderly: Use with caution in elderly patients with age-related renal impairment.
- Pediatrics: Safety and efficacy have not been established in children ≤2 years of age. Pediatric patients may have an increased risk of adverse effects, especially patients with asthma, sensitivity to allergens or medications, heart disease, or renal dysfunction.

Other warnings/precautions:

- Administration: For I.V. or intra-arterial use only. **[U.S. Boxed Warning]: May be fatal if given intrathecally.** Avoid extravasation, especially in patients with severe arterial or venous disease.
- Appropriate use: Adequately hydrate patient prior to and following administration. Delay intravenous contrast agent administration in patients who have recently received a cholecystographic contrast agent. In contrast-enhanced computerized tomography, contrast may obscure some lesions previously seen on unenhanced CT scans.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies do not show evidence of direct fetal harm. Embryolethality was observed, but may be related to maternal toxicity. Safety has not been established in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Vasodilatation (4%), chest pain (3%), hypertension (1%)

Central nervous system: Headache (6%), pain (2%), dizziness (1%)

Gastrointestinal: Nausea (4%), vomiting (2%), abnormal taste (1%),

Genitourinary: Urinary urgency (3%)

Local: Injection site hematoma (3%), injection site pain (1%)

Neuromuscular & skeletal: Back pain (3%)

Ocular: Abnormal vision (2%)

<1%: Abdominal pain, agitation, anxiety, apnea, arthralgia, asthenia, asthma, AV block (complete), bradycardia, chills, confusion, constipation, cough increased, coronary thrombosis, depression, diaphoresis increased, diarrhea, dry mouth, dysmenorrhea, dyspepsia, dyspnea, dysuria, emotional lability, facial edema, fever, hypertonia, hypoesthesia, hypotension, hypoxemia, hypoxia, incoordination, injection site reactions (edema, erythema, rash, warm feeling), insomnia, kidney pain, malaise, myasthenia, neck pain, neuropathy, paresthesia, pharyngitis, polydypsia, premature ventricular contractions, pruritus, pulmonary hypertension, salivation, seizure, somnolence, sore throat, speech disorder, syncope, tenesmus, tremor, urticaria, urinary retention, vascular anomaly, visual field defect

Postmarketing and/or case reports: Amnesia, anaphylaxis, angioedema (pediatric), aphasia, brain edema (pediatric), bullous eruption (delayed), erythema (delayed), CHF, conjunctivitis (pediatric), diabetes insipidus (pediatric), epistaxis (pediatric), fixed eruptions (pediatric), hematuria, hemopericardium, hypersensitivity, hypotonia, hypovolemic shock, hypoxia (pediatric), joint effusion (pediatric), lacrimation disorder, laryngeal edema, migraine (pediatric), mucosal swelling (pediatric), muscle cramping (pediatric), mydriasis, nephropathy, papular rash (delayed), renal failure, skin discoloration, skin eruption (delayed), sneezing (delayed), tachycardia, thrombosis, tongue paralysis, ventricular fibrillation, vertigo (pediatric), wheals (delayed)

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Test InteractionsThyroid function tests (which depend on estimates of iodine) will not accurately assess function for at least 16 days following administration of iodinated contrast agents. Iopromide may affect PTT, calcium thromboplastin time, and thrombin activity. It may activate the complement alternate pathway. No effects on Factor XIIa have been demonstrated.

Monitoring ParametersCoronary arteriography: ECG (coronary arteriography); vital signs; signs and symptoms of hypersensitivity; renal function

Monitoring: Lab TestsRenal function

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution (Ultravist®):

Iodine 150 mg/mL (provides iopromide 311.7 mg/mL) (50 mL) [contains edetate calcium disodium 0.1 mg]

Iodine 240 mg/mL (provides iopromide 498.72 mg/mL) (50 mL, 100 mL, 200 mL) [contains edetate calcium disodium 0.1 mg]

Iodine 300 mg/mL (provides iopromide 623.4 mg/mL) (50 mL, 100 mL, 150 mL, 500 mL) [contains edetate calcium disodium 0.1 mg]

Iodine 370 mg/mL (provides iopromide 768.86 mg/mL) (50 mL, 100 mL, 150 mL, 200 mL, 500 mL) [contains edetate calcium disodium 0.1 mg]

Generic AvailableNo

ManufacturerBayer HealthCare Pharmaceuticals Inc

Mechanism of ActionIopromide opacifies vessels in its path of flow, permitting radiographic visualization of internal structures.

Pharmacodynamics/Kinetics

Distribution: V_d: 16 L

Protein binding: 1%

Half-life elimination: Main phase: 2 hours, terminal phase: 6.2 hours

Time to peak:

Intravascular: Contrast enhancement: 15-120 seconds after bolus injection

Intravenous: Contrast enhancement: Kidneys: 5-15 minutes

Excretion: Urine 97% (as unchanged drug)

Pharmacotherapy PearlsSeafood allergy: There is a concern that an allergy to seafood may increase the risk of hypersensitivity reactions to iodinated contrast agents due to the iodine content in food. The American College of Radiology and The American Academy of Allergy, Asthma, and Immunology both agree that allergy to seafood or shellfish does not pose any increased risk of hypersensitivity over any other food allergies. Patients with food allergies or asthma may have an increased risk of being atopic, which may put them at an increased risk for hypersensitivity reactions over those who do not.

Osmolality:

150 mg iodine/mL: 328

240 mg iodine/mL: 483

300 mg iodine/mL: 607

370 mg iodine/mL: 774

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause agitation, amnesia, anxiety, confusion, depression, emotional lability, insomnia, malaise, or somnolence.

Mental Health: Effects on Psychiatric TreatmentNone reported

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Pregnancy Risk FactorB

Pregnancy ConsiderationsHarm to the fetus was not observed in animal studies. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsBottle feedings are recommended for 24 hours after administration.

Drug Interactions

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 66.8% (50 mL) [provides organically-bound iodine 400 mg/mL; contains edetate calcium disodium, sodium 24.2 mg (1.05 mEq)/mL]

Generic AvailableNo

ManufacturerMallinckrodt

Pharmacotherapy PearlsInformation in this monograph is currently limited to the fields presented. Consult product labeling for additional details.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(EYE oh ver sole)
U.S. Brand NamesOptiray®
Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Nonionic, Low Osmolality)
Use: Labeled IndicationsArteriography, angiography, angiocardiography, ventriculography, excretory urography, and venography procedures; contrast enhanced tomographic imaging
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from strong daylight or direct exposure to the sun.
ContraindicationsHypersensitivity to any component of the formulation; not intended for intrathecal use
Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsTemporary discontinuation of nursing should be considered.
Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

160: 34% (50 mL) [provides organically-bound iodine 160 mg/mL; contains tromethamine 3.6 mg/mL, edetate calcium disodium]

240: 51% (50 mL, 100 mL, 125 mL, 200 mL, 500 mL) [provides organically-bound iodine 240 mg/mL; contains tromethamine 3.6 mg/mL, edetate calcium disodium]

300: 64% (50 mL, 100 mL, 150 mL, 200 mL) [provides organically-bound iodine 300 mg/mL; contains tromethamine 3.6 mg/mL, edetate calcium disodium]

320: 68% (20 mL, 30 mL, 50 mL, 75 mL, 100 mL, 125 mL, 150 mL, 200 mL, 250 mL) [provides organically-bound iodine 320 mg/mL; contains tromethamine 3.6 mg/mL, edetate calcium disodium]

350: 74% (50 mL, 75 mL, 100 mL, 150 mL, 200 mL, 250 mL, 500 mL) [provides organically-bound iodine 350 mg/mL; contains tromethamine 3.6 mg/mL, edetate calcium disodium]

Generic AvailableNo

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye ox AG late MEG loo meen & eye ox AG late SOW dee um)
U.S. Brand NamesHexabrix™
Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Ionic, Low Osmolality)
Use: Labeled IndicationsAngiocardiography, arteriography, aortography, arthrography, angiography, hysterosalpingography, venography, and urography procedures; contrast enhancement of computed tomographic imaging
StorageStore below 30°C (86°F). Protect from strong daylight or direct exposure to the sun.
ContraindicationsHypersensitivity to ioxaglate or any component of the formulation; myelography; hysterosalpingography during the menstrual period, pregnancy, genital tract infection, or cervical conization or curettage within 30 days; arthrography with infection present in or near the joint
Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Pregnancy Risk FactorB
Pregnancy ConsiderationsAnimal reproduction studies did not show fetal harm. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsBottle feedings are recommended for 24 hours after administration.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: Ioxaglate meglumine 39.3% and ioxaglate sodium 19.6% (20 mL, 50 mL, 100 mL, 150 mL, 200 mL) [provides organically-bound iodine 32% (320 mg/mL); contains edetate calcium disodium, sodium 3.48 mg (0.15 mEq)/mL]

Generic AvailableNo
ManufacturerMallinckrodt
Pharmacotherapy PearlsInformation in this monograph is currently limited to the fields presented. Consult product labeling for additional details.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsIoxaglate Sodium and Ioxaglate Meglumine

Ioxilan

Lexi-Drugs Online

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye OKS ee lan)

U.S. Brand NamesOxilan®

Canadian Brand NamesOxilan® 300; Oxilan® 350

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Nonionic, Low Osmolality)

Use: Labeled Indications

Intra-arterial: Ioxilan 300 mgI/mL is indicated for cerebral arteriography. Ioxilan 350 mgI/mL is indicated for coronary arteriography and left ventriculography, visceral angiography, aortography, and peripheral arteriography

Intravenous: Both products are indicated for excretory urography and contrast-enhanced computed tomographic (CECT) imaging of the head and body

Dosing: Adults

Coronary arteriography and left ventriculography: Intra-arterial: For visualization of coronary arteries and left ventricle, ioxilan injection with a concentration of 350 mg iodine/mL is recommended

Usual injection volumes:

Left and right coronary: 2-10 mL (0.7-3.5 g iodine)

Left ventricle: 25-50 mL (8.75-17.5 g iodine)

Total doses should not exceed 250 mL; the injection rate of ioxilan should approximate the flow rate in the vessel injected

Cerebral arteriography: Intra-arterial: For evaluation of arterial lesions of the brain, a concentration of 300 mg iodine/mL is indicated

Recommended doses: 8-12 mL (2.4-3.6 g iodine)

Total dose should not exceed 150 mL

Dosing: ElderlyRefer to adult dosing.

StorageStore at 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light.

ContraindicationsHypersensitivity to ioxilan or any component of the formulation; ioxilan injection is not indicated for intrathecal use

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Administration: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylaxis: May cause serious and potentially fatal anaphylactoid reactions.
- Contrast dye/iodine hypersensitivity: Use with caution in patients with history of previous reaction to contrast dye or iodine.
- Thromboembolic events: Serious, rarely fatal, thromboembolic events causing myocardial infarction and stroke have been reported during angiographic procedures with both ionic and nonionic contrast media. Therefore, meticulous intravascular administration technique is necessary.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment, especially those with concomitant renal dysfunction or when using both oral and IV contrast agents in close proximity.

- Multiple myeloma: Use with caution in patients with multiple myeloma; may worsen renal insufficiency.

- Pheochromocytoma: Use with extreme caution in patients with known or suspected pheochromocytoma. Dose injected should be kept to a minimum to minimize exposure; monitor blood pressure closely.

- Renal impairment: Use with caution in patients with renal impairment; clearance is reduced.

- Sickle cell disease: Use with caution in patients with sickle cell disease; may promote sickling.

- Thyroid dysfunction: Use with caution in patients with thyroid disease; thyroid storm has been reported in patients with history of hyperthyroidism.

Special populations:

- Elderly: Use with caution in elderly patients with age-related renal impairment.

Other warnings/precautions:

- Administration: For I.V. or intra-arterial use only. **[U.S. Boxed Warning]: May be fatal if given intrathecally.** Avoid extravasation, especially in patients with severe arterial or venous disease.

- *In vitro* clotting: Clotting has been reported when blood remains in contact with syringes containing ioxilan; use of plastic syringes in place of glass syringes has been reported to decrease, but not eliminate, the likelihood of *in vitro* clotting.

Pregnancy Risk FactorB

Pregnancy ConsiderationsFetal harm was not observed in animal studies. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Angina (1%), hypertension (1%)

Central nervous system: Headache (4%), fever (2%)

Gastrointestinal: Nausea (2%)

<1%: Bradycardia, chills, diarrhea, dizziness, hypotension, injection site hematomas, rash, urticaria, vomiting

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Test InteractionsThe results of protein-bound iodine and radioactive iodine uptake studies, which depend on iodine estimations, will not accurately reflect thyroid function for at least 16 days following administration of iodinated contrast media. However, thyroid function tests that do not depend on iodine estimations (eg, T_3 resin uptake and total or free thyroxine (T_4) assays), are not affected.

Monitoring ParametersPrior to and 24-48 hours after intravascular administration: Thyroid function tests, renal function tests, blood counts, serum electrolytes, and urinalysis should be monitored for and blood pressure, heart rate, electrocardiogram, and temperature should be monitored throughout the procedure

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Oxilan® 300: 62% (50 mL, 100 mL, 150 mL, 200 mL) [provides organically-bound iodine 300 mg/mL; contains sodium 0.22 mg (0.01 mEq)/mL, edetate calcium disodium]

Oxilan® 350: 73% (50 mL, 100 mL, 150 mL, 200 mL) [provides organically- bound iodine 350 mg/mL; contains sodium 0.22 mg (0.01 mEq)/mL, edetate calcium disodium]

Generic AvailableNo

Mechanism of ActionIoxilan is a nonionic, water soluble, triiodinated x-ray contrast agent for intravascular injection. Intravascular injection of a radiopaque diagnostic agent opacifies those vessels in the path of flow of the contrast medium, permitting radiographic visualization of the internal structures of the human body until significant hemodilution occurs.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Ipecac Syrup

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(IP e kak SIR up)
Pharmacologic CategoryAntidote
Use: Labeled IndicationsTreatment of acute oral drug overdosage and in certain poisonings
Dosing: AdultsEmetic: Oral: 15-30 mL followed by 200-300 mL of water; repeat dose one time if vomiting does not occur within 20 minutes.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricEmetic: Oral:

6-12 months: 5-10 mL followed by 10-20 mL/kg of water; repeat dose one time if vomiting does not occur within 20 minutes.

1-12 years: 15 mL followed by 10-20 mL/kg of water; repeat dose one time if vomiting does not occur within 20 minutes.

Note: If emesis does not occur within 30 minutes after second dose, ipecac must be removed from stomach by gastric lavage.

Administration: OralDo **not** administer to unconscious patients. Patients should be kept active and moving following administration of ipecac. If vomiting does not occur after second dose, gastric lavage may be considered to remove ingested substance.
ContraindicationsHypersensitivity to ipecac or any component of the formulation; do not use in unconscious patients; patients with no gag reflex; following ingestion of strong bases, acids, or volatile oils; when seizures are likely
Warnings/Precautions

Disease-related concerns:

- Bulimia: Use with caution in patients with bulimia.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease.

Other warnings/precautions:

- Product confusion: Do not confuse ipecac syrup with ipecac fluid extract, which is 14 times more potent.

Other warnings/precautions:

- Antiemetic overdose: May not be effective in antiemetic overdose.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiotoxicity

Central nervous system: Lethargy

Gastrointestinal: Protracted vomiting, diarrhea

Neuromuscular & skeletal: Myopathy

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsFood: Milk, carbonated beverages may decrease effectiveness.
Nursing: Physical Assessment/MonitoringThe Poison Control Center should be contacted before administration. Administer only to conscious patients. If vomiting does not occur within 30 minutes, contact the Poison Control Center (or prescriber) again. Assess patient's knowledge for home use.
Patient EducationThe Poison Control Center should be contacted before administration. Take only as directed; do not take more than recommended or more often than recommended. Follow with 8 oz of water. If vomiting does not occur within 30 minutes, contact the Poison Control Center or emergency services again. Do not administer if vomiting. If vomiting occurs after taking, do not eat or drink until vomiting subsides. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup: 70 mg/mL (30 mL) [contains alcohol]

Generic AvailableYes
Mechanism of ActionIrritates the gastric mucosa and stimulates the medullary chemoreceptor trigger zone to induce vomiting
Pharmacodynamics/Kinetics

Onset of action: 15-30 minutes

Duration: 20-25 minutes; 60 minutes in some cases

Absorption: Significant amounts, mainly when it does not produce emesis

Excretion: Urine; emetine (alkaloid component) may be detected in urine 60 days after excess dose or chronic use

Pharmacotherapy PearlsThe benefit of ipecac syrup to treat poisoning in children has been questioned. In November 2003, the American Academy of Pediatrics recommended that syrup of ipecac no longer be used routinely for the management of poisonings in the home. They advised parents to dispose of existing supplies of ipecac to help prevent inappropriate use.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentCombination with chlorpromazine has been associated with dystonic reactions

Index TermsSyrup of Ipecac

Medication Safety Issues

Sound-alike/look-alike issues:

Combivent® may be confused with Combivir®, Serevent®

International issues:

DuoNeb® may be confused with DuoTrav™ which is a brand name for travoprost/timolol combination product in Canada

Pronunciation(i pra TROE pee um & al BYOO ter ole)
U.S. Brand NamesCombivent®; DuoNeb®
Canadian Brand NamesCO Ipra-Sal; Combivent®; Gen-Combo Sterinebs; ratio-Ipra Sal UDV
Pharmacologic CategoryBronchodilator
Use: Labeled IndicationsTreatment of COPD in those patients who are currently on a regular bronchodilator who continue to have bronchospasms and require a second bronchodilator
Dosing: Adults

COPD:

Aerosol for inhalation: 2 metered-dose inhalations 4 times/day; may receive additional doses as necessary, but total number of doses in 24 hours should not exceed 12 inhalations.

Solution for nebulization: Initial: 3 mL every 6 hours (maximum: 3 mL every 4 hours)

Dosing: ElderlyRefer to adult dosing.
Administration: InhalationNebulization: Administer via jet nebulizer to an air compressor with an adequate air flow, equipped with a mouthpiece or face mask. MDI: Shake canister vigorously for ≥10 seconds. Prior to first use (or if not used for >24 hours) a test spray of 3 sprays is recommended. Avoid spraying into eyes.
Dietary ConsiderationsSome dosage forms may contain soya lecithin. Do not use in patients allergic to soya lecithin or related food products such as soybean and peanut.
Storage

DuoNeb®: Store at 2°C to 30°C (36°F to 86°F). Protect from light.

Combivent®: Store at 15°C to 30°C (59°F to 86°F). Avoid excessive humidity. Do not store near heat or open flame.

ContraindicationsHypersensitivity to ipratropium, albuterol, atropine (and its derivatives) or any component of the formulation
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.
- Sympathomimetic amines sensitivity: Use albuterol with caution in patients with a sensitivity to sympathomimetic amines.

Disease-related concerns:

- Asthma: Appropriate use: Ipratropium is not indicated for the initial treatment of acute episodes of bronchospasm.
- Cardiovascular disease: Use albuterol with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.
- Diabetes: Use albuterol with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.
- Glaucoma: Use ipratropium with caution in patients with narrow-angle glaucoma.
- Hyperthyroidism: Use albuterol with caution in hyperthyroidism; may stimulate thyroid activity.

- Prostatic hyperplasia/bladder neck obstruction: Use ipratropium with caution in patients with prostatic hyperplasia or bladder neck obstruction.

- Seizure disorder: Use albuterol with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Elderly: Ipratropium has not been specifically studied in the elderly, but it is poorly absorbed from the airways and appears to be safe in this population. Because of its minimal effect on beta$_1$-receptors and its relatively long duration of action, albuterol is a rational choice in the elderly when a beta-agonist is indicated; oral albuterol use should be avoided in the elderly due to adverse effects.

- Pediatrics: Some adverse reactions may occur more frequently in children 2-5 years of age than in adults and older children. Safety and efficacy have not been established in children.

Dosage form specific issues:

- Soya lecithin: Some dosage forms contain soya lecithin; may cause allergic reactions in patients with allergy to soya lecithin or related food products (eg, soybean and peanut)

Other warnings/precautions:

- Appropriate use: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

- Patient education: A spacer device is recommended when using a metered-dose inhaler.

- Tolerance: Excessive use may result in tolerance.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.
Breast-Feeding ConsiderationsSee individual agents.
Adverse Reactions

Percentages reported with either combination product (not versus placebo). Also see individual agents.

>10%: Respiratory: Bronchitis (2% to 12%), upper respiratory tract infection (11%)

1% to 10%:

Cardiovascular: Chest pain (≤3%), angina (<2%), arrhythmia (<2%), edema (<2%), hypertension (<2%), palpitation (<2%), tachycardia (<2%)

Central nervous system: Headache (6%), pain (1% to 3%), dizziness (<2%), fatigue (<2%), insomnia (<2%), nervousness (<2%), tremor (<2%)

Gastrointestinal: Diarrhea (≤2%), dyspepsia (≤2%), sputum increased (<2%), taste perversion (<2%), vomiting (<2%), xerostomia (<2%), nausea (1% to 2%), dyspepsia (≤1%), constipation

Genitourinary: Urinary tract infection (≤2%)

Neuromuscular & skeletal: Arthralgia (<2%), paresthesia (<2%), leg cramps (1%)

Respiratory: Lung disease (6%), dyspnea (5%), cough (4%), pharyngitis (2% to 4%), respiratory disorder (3%), sinusitis (2%), pneumonia (1%), rhinitis (1%)

Miscellaneous: Dysphonia (<2%), flu-like syndrome (1%)

<1%: Allergic reactions (angioedema of tongue, lips or face; laryngospasm, pruritus, rash, urticaria); anaphylactic reaction, bronchospasm

Metabolism/Transport EffectsAlbuterol: **Substrate** of CYP3A4 (major)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersSpirometry (FEV, FVC); weight

Medication Safety Issues

Sound-alike/look-alike issues:

Atrovent® may be confused with Alupent®, Serevent®

Pronunciation(i pra TROE pee um)

U.S. Brand NamesAtrovent®; Atrovent® HFA

Canadian Brand NamesAlti-Ipratropium; Apo-Ipravent®; Atrovent®; Atrovent® HFA; Gen-Ipratropium; Novo-Ipramide; Nu-Ipratropium; PMS-Ipratropium

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled Indications

Oral inhalation: Anticholinergic bronchodilator used in bronchospasm associated with COPD, bronchitis, and emphysema

Nasal spray: Symptomatic relief of rhinorrhea associated with the common cold and allergic and nonallergic rhinitis

Use: Unlabeled/InvestigationalOral inhalation: Adjunct to short-acting beta-adrenergic agonists therapy in moderate-to-severe exacerbations of acute asthma in the emergency room

Dosing: Adults

Asthma exacerbation, acute (*NIH Asthma Guidelines, 2007*):

Nebulization: 500 mcg every 20 minutes for 3 doses, then as needed. **Note:** Should be given in combination with a short-acting beta-adrenergic agonist.

Metered-dose inhaler: 8 inhalations every 20 minutes as needed for up to 3 hours. **Note:** Should be given in combination with a short-acting beta-adrenergic agonist.

Bronchospasm associated with COPD:

Nebulization: 500 mcg (one unit-dose vial) 3-4 times/day with doses 6-8 hours apart

Metered-dose inhaler: 2 inhalations 4 times/day, up to 12 inhalations/24 hours

Colds (symptomatic relief of rhinorrhea): Safety and efficacy of use beyond 4 days not established: *Intranasal:* Nasal spray (0.06%): 2 sprays in each nostril 3-4 times/day

Allergic/nonallergic rhinitis:*Intranasal:* Nasal spray (0.03%): 2 sprays in each nostril 2-3 times/day

Seasonal allergic rhinitis (safety and efficacy of use beyond 3 weeks in patients with seasonal allergic rhinitis has not been established): *Intranasal:* Nasal spray (0.06%): 2 sprays in each nostril 4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asthma exacerbation, acute (*NIH Asthma Guidelines, 2007*):

Nebulization:

Children ≤12 years: 250-500 mcg every 20 minutes for 3 doses, then as needed. **Note:** Should be given in combination with a short-acting beta-adrenergic agonist.

Children >12 years: Refer to adult dosing.

Metered-dose inhaler:

Children ≤12 years: 4-8 inhalations every 20 minutes as needed for up to 3 hours. **Note:** Should be given in combination with a short-acting beta-adrenergic agonist.

Children >12 years: Refer to adult dosing.

Colds (symptomatic relief of rhinorrhea): Intranasal: Safety and efficacy of use beyond 4 days in patients with the common cold have not been established:

Children 5-11 years: 0.06%: 2 sprays in each nostril 3 times/day

Children ≥12 years and Adults: 0.06%: 2 sprays in each nostril 3-4 times/day

Allergic/nonallergic rhinitis: Intranasal: Children ≥6 years: Refer to adult dosing.

Seasonal allergic rhinitis: Intranasal: Children ≥5 years: Refer to adult dosing.

Administration: Inhalation

Atrovent® HFA: Prior to initial use, prime inhaler by releasing 2 test sprays into the air. If the inhaler has not been used for >3 days, reprime.

Nasal spray: Prior to initial use, prime inhaler by releasing 7 test sprays into the air. If the inhaler has not been used for >24 hours, reprime by releasing 2 test sprays into the air.

Storage

Oral inhalation aerosol and nasal spray: Store at controlled room temperature of 25°C (77°F). Do not store near heat or open flame.

Oral inhalation solution: Store at 15°C to 30°C (59°F to 86°F). Protect from light.

CompatibilityCompatible for 1 hour when mixed with albuterol in a nebulizer.
ContraindicationsHypersensitivity to ipratropium, atropine (and its derivatives), or any component of the formulation
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

Disease-related concerns:

- Glaucoma: Use with caution in patients with narrow-angle glaucoma.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Prostatic hyperplasia/bladder neck obstruction: Use with caution in patients with prostatic hyperplasia or bladder neck obstruction.

Other warnings/precautions:

- Appropriate use: Inhalation/nebulizer not indicated for the initial treatment of acute episodes of bronchospasm where rescue therapy is required for rapid response. Should only be used in acute exacerbations of asthma in conjunction with short-acting beta-adrenergic agonists for acute episodes.

Geriatric ConsiderationsThe elderly may find it difficult to use the metered dose inhaler. A spacer device may be useful. Ipratropium has not been specifically studied in the elderly, but it is poorly absorbed from the airways and appears to be safe in this population.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

Inhalation aerosol and inhalation solution:

>10%: Respiratory: Upper respiratory tract infection (9% to 34%), bronchitis (10% to 23%), sinusitis (1% to 11%)

1% to 10%:

Cardiovascular: Chest pain (3%), palpitation

Central nervous system: Headache (6% to 7%), dizziness (2% to 3%)

Gastrointestinal: Dyspepsia (1% to 5%), nausea (4%), xerostomia (2% to 4%)

Genitourinary: Urinary tract infection (2% to 10%)

Neuromuscular & skeletal: Back pain (2% to 7%)

Respiratory: Dyspnea (7% to 10%), rhinitis (2% to 6%), cough (3% to 5%), pharyngitis (4%), bronchospasm (2%), sputum increased (1%)

Miscellaneous: Flu-like syndrome (4% to 8%)

<1%, postmarketing, and/or case reports: Anaphylactic reaction, angioedema, arthritis, atrial fibrillation, bitter taste, constipation, diarrhea, eye pain (acute), glaucoma, hypersensitivity reactions, hypotension, insomnia, laryngospasm, mydriasis, nervousness, pruritus, rash, tachycardia (including supraventricular), tremor, urinary retention, urticaria

Nasal spray:

1% to 10%:Central nervous system: Headache (4% to 10%)

Gastrointestinal: Taste perversion (≤4%), xerostomia (1% to 4%), diarrhea (2%), nausea (2%)

Respiratory: Epistaxis (6% to 9%), pharyngitis (≤8%), upper respiratory tract infection (5% to 10%), nasal dryness (<1% to 5%), nasal irritation (2%), nasal congestion (1%)

<2%, postmarketing, and/or case reports: Anaphylactic reaction, angioedema, blurred vision, conjunctivitis, cough, dizziness, hoarseness, laryngospasm, nasal burning, ocular irritation, palpitation, rash, tachycardia, thirst, tinnitus, urticaria, xerostomia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially anything that may have anticholinergic properties). Assess patient response on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use exactly as directed (see below). Use care to avoid direct contact with eyes. Do not use more often than recommended. Store solution away from light. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause sensitivity to heat (avoid extremes in temperature); nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth, unpleasant taste, stomach upset (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help); or difficulty urinating (always void before treatment). Report unresolved GI upset, dizziness or fatigue, vision changes, palpitations, persistent inability to void, nervousness, or insomnia. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Inhaler: Follow instructions for use accompanying the product. Close eyes when administering ipratropium; blurred vision may result if sprayed into eyes. Effects are enhanced by holding breath 10 seconds after inhalation; wait at least 1 full minute between inhalations.

Nebulizer: Wash hands before and after treatment. Wash and dry nebulizer after each treatment. Twist open the top of one unit dose vial and squeeze the contents into the nebulizer reservoir. Connect the nebulizer reservoir to the mouthpiece or face mask. Connect nebulizer to compressor. Sit in a comfortable, upright position. Place mouthpiece in your mouth or put on the face mask and turn on the compressor. If a face mask is used, avoid leakage around the mask (temporary blurring of vision, worsening of narrow-angle glaucoma, or eye pain may occur if mist gets into eyes). Breathe calmly and deeply until no more mist is formed in the nebulizer (about 5 minutes). At this point, treatment is finished.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol for oral inhalation, as bromide:

Atrovent® HFA: 17 mcg/actuation (12.9 g)

Solution for nebulization, as bromide: 0.02% (2.5 mL)

Solution, intranasal, as bromide [spray]:

Atrovent®: 0.03% (30 mL); 0.06% (15 mL)

Generic AvailableYes: Excludes solution for oral inhalation, aerosol for oral inhalation

Pricing: U.S. (www.drugstore.com)

Aerosol solution (Atrovent HFA)

17 mcg/ACT (12.9): $107.91

Solution (Atrovent)

0.03% (30): $84.70

0.06% (15): $76.98

Solution (Ipratropium Bromide)

0.03% (30): $37.95

0.06% (15): $33.95

Mechanism of ActionBlocks the action of acetylcholine at parasympathetic sites in bronchial smooth muscle causing bronchodilation; local application to nasal mucosa inhibits serous and seromucous gland secretions.

Pharmacodynamics/Kinetics

Onset of action: Bronchodilation: Within 15 minutes

Peak effect: 1-2 hours

Duration: 2-5 hours

Absorption: Negligible

Distribution: Inhalation: 15% of dose reaches lower airways

Protein Binding: ≤9%

Half-life elimination: 2 hours

Excretion: Urine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Avalide® may be confused with Avandia®

Pronunciation(ir be SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesAvalide®

Canadian Brand NamesAvalide®

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsCombination therapy for the management of hypertension; may be used as initial therapy in patients likely to need multiple drugs to achieve blood pressure goals

Note: In Canada, this combination product is approved for initial therapy in severe, essential hypertension (sitting diastolic blood pressure [DBP] ≥110 mm Hg).

Dosing: AdultsOral: Dose must be individualized.

Hypertension:

Add-on therapy: A patient who is not controlled with either agent alone may be switched to the combination product. Mean effect increases with the dose of each component. The lowest dosage available is irbesartan 150 mg/hydrochlorothiazide 12.5 mg. Dose increases should be made not more frequently than every 2-4 weeks.

Initial therapy: Irbesartan 150 mg/hydrochlorothiazide 12.5 mg once daily. If initial response is inadequate, may titrate dose after 2-4 weeks, to a maximum dose of irbesartan 300 mg/hydrochlorothiazide 25 mg once daily.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended in patients with Cl_{cr} ≤30 mL/minute.

Dosing: Hepatic ImpairmentUse with caution.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to irbesartan, hydrochlorothiazide, or any component of the formulation; sulfonamide-derived drugs; anuria

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first. Combination product not recommended as initial therapy in patients with volume depletion.

- Renal artery stenosis: Use irbesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use irbesartan with caution with pre-existing renal insufficiency and severe renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs. Combination product not recommended in patients with Cl_{cr} ≤30 mL/minute.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/contraindicated
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsIrbesartan: **Substrate** of CYP2C9 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (moderate), 2D6 (weak), 3A4 (weak)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Irbesartan. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersAssess weight, I & O reports daily to determine fluid loss; blood pressure, symptomatic hypotension, and tachycardia; serum electrolytes, BUN, creatinine

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSerum electrolytes, BUN, creatinine

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Irbesartan 150 mg and hydrochlorothiazide 12.5 mg

Irbesartan 300 mg and hydrochlorothiazide 12.5 mg

Irbesartan 300 mg and hydrochlorothiazide 25 mg

Generic AvailableNo

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Avalide)

150-12.5 mg (30): $85.59

300-12.5 mg (30): $85.99

300-25 mg (30): $99.50

Mechanism of Action

Irbesartan: Irbesartan is an angiotensin receptor antagonist. Angiotensin II acts as a vasoconstrictor. In addition to causing direct vasoconstriction, angiotensin II also stimulates the release of aldosterone. Once aldosterone is released, sodium as well as water are reabsorbed. The end result is an elevation in blood pressure. Irbesartan binds to the AT1 angiotensin II receptor. This binding prevents angiotensin II from binding to the receptor thereby blocking the vasoconstriction and the aldosterone secreting effects of angiotensin II.

Hydrochlorothiazide: Inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Hydrochlorothiazide
- Irbesartan

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, nervousness

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Index TermsAvapro® HCT; Hydrochlorothiazide and Irbesartan

Medication Safety Issues

Sound-alike/look-alike issues:

Avapro® may be confused with Anaprox®

Pronunciation(ir be SAR tan)

U.S. Brand NamesAvapro®

Canadian Brand NamesAvapro®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsTreatment of hypertension alone or in combination with other antihypertensives; treatment of diabetic nephropathy in patients with type 2 diabetes mellitus (noninsulin dependent, NIDDM) and hypertension

Use: Unlabeled/InvestigationalTo slow the rate of progression of aortic-root dilation in pediatric patients with Marfan's syndrome

Dosing: Adults

Hypertension: Oral: 150 mg once daily; patients may be titrated to 300 mg once daily. **Note:** Starting dose in volume-depleted patients should be 75 mg.

Nephropathy in patients with type 2 diabetes and hypertension: Oral: Target dose: 300 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Hypertension:** Oral:

<6 years: Safety and efficacy have not been established.

≥6-12 years: Initial: 75 mg once daily; may be titrated to a maximum of 150 mg once daily

13-16 years: Refer to adult dosing.

Aortic-root dilation with Marfan's syndrome (unlabeled use): Children 14 months to 16 years: Initial: 1.4 mg/kg/day; can be increased to a maximum of 2 mg/kg/day (not to exceed adult maximum of 300 mg/day)

Dosing: Renal ImpairmentNo dosage adjustment necessary with mild to severe impairment unless the patient is also volume depleted.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to irbesartan or any component of the formulation

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See "Special populations" below.

Concerns related to adverse effects:

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Hypovolemia: Avoid use or use smaller doses in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use irbesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution with pre-existing renal insufficiency, and severe renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsNo dosage adjustment is necessary when initiating angiotensin II receptor antagonists in the elderly. In clinical studies, no differences between younger adults and the elderly were demonstrated. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.
Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)
Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsUnless otherwise indicated, percentage of incidence is reported for patients with hypertension.

>10%: Endocrine & metabolic: Hyperkalemia (19%, diabetic nephropathy; rarely seen in HTN)

1% to 10%:

Cardiovascular: Orthostatic hypotension (5%, diabetic nephropathy)

Central nervous system: Fatigue (4%), dizziness (10%, diabetic nephropathy)

Gastrointestinal: Diarrhea (3%), dyspepsia (2%)

Respiratory: Upper respiratory infection (9%), cough (2.8% versus 2.7% in placebo)

>1% but frequency ≤ placebo: Abdominal pain, anxiety, chest pain, edema, headache, influenza, musculoskeletal pain, nausea, nervousness, pharyngitis, rash, rhinitis, sinus abnormality, syncope, tachycardia, urinary tract infection, vertigo, vomiting

<1% (Limited to important or life-threatening): Abdominal distension, abnormal urination, angina, arrhythmia, arthritis, bronchitis, bursitis, cardiopulmonary arrest, cerebrovascular accident, chest pain (noncardiac), chills, congestion, conjunctivitis, constipation, depression, dermatitis, dyspnea, ear infection, ear pain, ecchymosis, epistaxis, erythema, facial edema, fever, flatulence, flushing, gastroenteritis, gout, hearing abnormality, heart failure, hyper-/hypotension, hypertensive crisis, libido decreased, MI, muscle aches, muscle cramps, muscle weakness, numbness, orthostatic hypotension, paresthesia, prostate disorder, pruritus, pulmonary congestion, serum creatinine increased (0.7% versus 0.9% in placebo), sexual dysfunction, sleep disturbance, somnolence, TIA, tremor, upper extremity edema, vision disturbance, wheezing. May be associated with worsening of renal function in patients dependent on renin-angiotensin-aldosterone system.

Postmarketing reports: Angioedema, hepatitis, jaundice, transaminases increased, urticaria; rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (moderate), 2D6 (weak), 3A4 (weak)
Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Irbesartan. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Nursing: Physical Assessment/MonitoringUse caution in presence of renal insufficiency or aortic/mitral stenosis. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (risk of hyperkalemia or toxicity). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypotension) at regular intervals during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsElectrolytes, serum creatinine, BUN, urinalysis

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not discontinue without consulting prescriber. May be taken with or without food. Take first dose at bedtime. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or abdominal pain (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, yogurt may help). Report chest pain or palpitations, skin rash, fluid retention (swelling of extremities), respiratory difficulty or unusual cough, or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 75 mg, 150 mg, 300 mg

Generic AvailableNo

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Avapro)

75 mg (30): $70.61

150 mg (30): $75.99

300 mg (30): $79.99

Mechanism of ActionIrbesartan is an angiotensin receptor antagonist. Angiotensin II acts as a vasoconstrictor. In addition to causing direct vasoconstriction, angiotensin II also stimulates the release of aldosterone. Once aldosterone is released, sodium as well as water are reabsorbed. The end result is an elevation in blood pressure. Irbesartan binds to the AT1 angiotensin II receptor. This binding prevents angiotensin II from binding to the receptor thereby blocking the vasoconstriction and the aldosterone secreting effects of angiotensin II.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 1-2 hours

Duration: >24 hours

Distribution: V_d: 53-93 L

Protein binding, plasma: 90%

Metabolism: Hepatic, primarily CYP2C9

Bioavailability: 60% to 80%

Half-life elimination: Terminal: 11-15 hours

Time to peak, serum: 1.5-2 hours

Excretion: Feces (80%); urine (20%)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, nervousness

Mental Health: Effects on Psychiatric Treatment

None reported

Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Marfan's Syndrome: Marfan's syndrome is a genetic disorder due to a mutation in the gene encoding for fibrillin-1 (FBN-1) and is associated with progressive aortic root dilation and may subsequently result in aortic dissection. The deficiency of FBN-1 leads to an increase in the activity of transforming growth factor β (TGF-β) which is thought to contribute to aortic root dilation and other Marfan's syndrome characteristics. Angiotensin II receptor blockers have been shown to inhibit TGF-β signaling.

Recently, a retrospective study evaluated the use of angiotensin II receptor blockers specifically losartan (1 patient received irbesartan) in a cohort of 18 pediatric patients (age range 14 months to 16 years) with Marfan's syndrome. All patients had evidence of severe aortic root enlargement. Patients who received losartan were initiated with 0.6 mg/kg/day and increased to a maximum dose of 1.4 mg/kg/day. The patient who received irbesartan was initiated with 1.4 mg/kg/day and increased to a maximum dose of 2 mg/kg/day. Patients were followed for a median of 26 months. The mean rate of change in aortic-root diameter prior to initiation of ARB therapy was 3.54 ± 2.87 mm per year. After initiation of ARB therapy, the rate of change decreased to 0.46 ± 0.62 mm per year ($p<0.001$). A similar decline in rate of change was seen in the patient treated with irbesartan. This small cohort study demonstrates that ARB therapy in patients with aortic-root dilation due to Marfan's syndrome may be of benefit. Future randomized controlled clinical trials will be needed to confirm these findings (Brooke, 2008).

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other Considerations

The angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye rye no TEE kan)

U.S. Brand NamesCamptosar®

Canadian Brand NamesCamptosar®; Irinotecan Hydrochloride Trihydrate

Pharmacologic CategoryAntineoplastic Agent, Camptothecin; Antineoplastic Agent, Natural Source (Plant) Derivative

Use: Labeled IndicationsTreatment of metastatic carcinoma of the colon or rectum

Use: Unlabeled/InvestigationalLung cancer (small cell and nonsmall cell), cervical cancer, gastric cancer, pancreatic cancer, leukemia, lymphoma, breast cancer, brain tumors

Dosing: AdultsRefer to individual protocols. **Note:** A reduction in the starting dose by one dose level should be considered for patients ≥65 years of age, prior pelvic/abdominal radiotherapy, performance status of 2, homozygosity for UGT1A1*28 allele, or increased bilirubin (dosing for patients with a bilirubin >2 mg/dL cannot be recommended based on lack of data per manufacturer).

Single-agent therapy:

I.V.: Weekly regimen: 125 mg/m^2 over 90 minutes on days 1, 8, 15, and 22 of a 6-week treatment cycle

Adjusted dose level -1: 100 mg/m^2

Adjusted dose level -2: 75 mg/m^2

I.V.: Once-every-3-week regimen: 350 mg/m^2 over 90 minutes, once every 3 weeks

Adjusted dose level -1: 300 mg/m^2

Adjusted dose level -2: 250 mg/m^2

Depending on the patient's ability to tolerate therapy, doses should be adjusted in increments of 25-50 mg/m^2. Irinotecan doses may range from 50-150 mg/m^2 for the weekly regimen. Patients may be dosed as low as 200 mg/m^2 (in 50 mg/m^2 decrements) for the once-every-3-week regimen.

Combination therapy with fluorouracil and leucovorin: Six-week (42-day) cycle:

Regimen 1: I.V.: 125 mg/m^2 over 90 minutes on days 1, 8, 15, and 22; to be given in combination with bolus leucovorin and fluorouracil (leucovorin administered immediately following irinotecan; fluorouracil immediately following leucovorin)

Adjusted dose level -1: 100 mg/m^2

Adjusted dose level -2: 75 mg/m^2

Regimen 2: 180 mg/m^2 over 90 minutes on days 1, 15, and 29; to be given in combination with infusional leucovorin and bolus/infusion fluorouracil (leucovorin administered immediately following irinotecan; fluorouracil immediately following leucovorin)

Adjusted dose level -1: 150 mg/m^2

Adjusted dose level -2: 120 mg/m^2

Note: For all regimens: It is recommended that new courses begin only after the granulocyte count recovers to ≥1500/mm^3, the platelet count recovers to ≥100,000/mm^3, and treatment-related diarrhea has fully resolved. Treatment should be delayed 1-2 weeks to allow for recovery from treatment-related toxicities. If the patient has not recovered after a 2-week delay, consideration should be given to discontinuing irinotecan.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentEffects have not been evaluated; not recommended for use in patients on dialysis.

Dosing: Hepatic ImpairmentThe manufacturer recommends that no change in dosage or administration be made for patients with liver metastases and normal hepatic function. Consideration may be given to starting irinotecan at a lower dose (eg, 100 mg/m^2) if bilirubin is 1-2 mg/dL; for total serum bilirubin elevations >2 mg/dL, specific recommendations are not available in the FDA labeling. The following guidelines have been used by some clinicians:

Bilirubin 1.5-3 mg/dL: Administer 75% of dose (Floyd, 2006)

Dosing: Adjustment for ToxicityIt is recommended that new courses begin only after the granulocyte count recovers to ≥1500/mm^3, the platelet counts recover to ≥100,000/mm^3, and treatment-related diarrhea has fully resolved. Depending on the patient's ability to tolerate therapy, doses should be adjusted in increments of 25-50 mg/m^2. Treatment should be delayed 1-2 weeks to allow for recovery from treatment-related toxicities. If the patient has not recovered after a 2-week delay, consideration should be given to discontinuing irinotecan. See tables.

Single-Agent Schedule: Recommended Dosage Modifications[1]

Toxicity NCI Grade[2] (Value)	**During a Cycle of Therapy**	**At Start of Subsequent Cycles of Therapy (After Adequate Recovery), Compared to Starting Dose in Previous Cycle[1]**	
	Weekly	**Weekly**	**Once Every 3 Weeks**
No toxicity	Maintain dose level	↑ 25 mg/m^2 up to a maximum dose of 150 mg/m^2	Maintain dose level
Neutropenia			
1 (1500-1999/mm^3)	Maintain dose level	Maintain dose level	Maintain dose level
2 (1000-1499/mm^3)	↓ 25 mg/m^2	Maintain dose level	Maintain dose level
3 (500-999/mm^3)	Omit dose until resolved to ≤ grade 2, then ↓ 25 mg/m^2	↓ 25 mg/m^2	↓ 50 mg/m^2
4 (<500/mm^3)	Omit dose until resolved to ≤ grade 2, then ↓ 50 mg/m^2	↓ 50 mg/m^2	↓ 50 mg/m^2
Neutropenic Fever (grade 4 neutropenia and ≥ grade 2 fever)	Omit dose until resolved, then ↓ 50 mg/m^2	↓ 50 mg/m^2	↓ 50 mg/m^2
Other Hematologic Toxicities	Dose modifications for leukopenia, thrombocytopenia, and anemia during a course of therapy and at the start of subsequent courses of therapy are also based on NCI toxicity criteria and are the same as recommended for neutropenia above.		
Diarrhea			
1 (2-3 stools/day > pretreatment)	Maintain dose level	Maintain dose level	Maintain dose level
2 (4-6 stools/day > pretreatment)	↓ 25 mg/m^2	Maintain dose level	Maintain dose level
3 (7-9 stools/day > pretreatment)	Omit dose until resolved to ≤ grade 2, then ↓ 25 mg/m^2	↓ 25 mg/m^2	↓ 50 mg/m^2
4 (≥10 stools/day > pretreatment)	Omit dose until resolved to ≤ grade 2, then ↓ 50 mg/m^2	↓ 50 mg/m^2	↓ 50 mg/m^2
Other Nonhematologic Toxicities[3]			
1	Maintain dose level	Maintain dose level	Maintain dose level

2	↓ 25 mg/m^2	↓ 25 mg/m^2	↓ 50 mg/m^2
3	Omit dose until resolved to ≤ grade 2, then ↓ 25 mg/m^2	↓ 25 mg/m^2	↓ 50 mg/m^2
4	Omit dose until resolved to ≤ grade 2, then ↓ 50 mg/m^2	↓ 50 mg/m^2	↓ 50 mg/m^2

[1] All dose modifications should be based on the worst preceding toxicity.

[2] National Cancer Institute Common Toxicity Criteria (version 1.0).

[3] Excludes alopecia, anorexia, asthenia.

Combination Schedules: Recommended Dosage Modifications[1]

Toxicity NCI[2] Grade (Value)	**During a Cycle of Therapy**	**At the Start of Subsequent Cycles of Therapy (After Adequate Recovery), Compared to the Starting Dose in the Previous Cycle[1]**
No toxicity	Maintain dose level	Maintain dose level
Neutropenia		
1 (1500-1999/mm^3)	Maintain dose level	Maintain dose level
2 (1000-1499/mm^3)	↓ 1 dose level	Maintain dose level
3 (500-999/mm^3)	Omit dose until resolved to ≤ grade 2, then ↓ 1 dose level	↓ 1 dose level
4 (<500/mm^3)	Omit dose until resolved to ≤ grade 2, then ↓ 2 dose levels	↓ 2 dose levels
Neutropenic Fever (grade 4 neutropenia and ≥ grade 2 fever)	Omit dose until resolved, then ↓ 2 dose levels	
Other Hematologic Toxicities	Dose modifications for leukopenia or thrombocytopenia during a course of therapy and at the start of subsequent courses of therapy are also based on NCI toxicity criteria and are the same as recommended for neutropenia above.	
Diarrhea		
1 (2-3 stools/day > pretreatment)	Delay dose until resolved to baseline, then give same dose	Maintain dose level
2 (4-6 stools/day > pretreatment)	Omit dose until resolved to baseline, then ↓ 1 dose level	Maintain dose level
3 (7-9 stools/day > pretreatment)	Omit dose until resolved to baseline, then ↓ by 1 dose level	↓ 1 dose level
4 (≥10 stools/day > pretreatment)	Omit dose until resolved to baseline, then ↓ 2 dose levels	↓ 2 dose levels

Other Nonhematologic Toxicities[3]		
1	Maintain dose level	Maintain dose level
2	Omit dose until resolved to ≤ grade 1, then ↓ 1 dose level	Maintain dose level
3	Omit dose until resolved to ≤ grade 2, then ↓ 1 dose level	↓ 1 dose level
4	Omit dose until resolved to ≤ grade 2, then ↓ 2 dose levels	↓ 2 dose levels
Mucositis and/or stomatitis	Decrease only 5-FU, not irinotecan	Decrease only 5-FU, not irinotecan
[1] All dose modifications should be based on the worst preceding toxicity.		
[2] National Cancer Institute Common Toxicity Criteria (version 1.0).		
[3] Excludes alopecia, anorexia, asthenia.		

Dosing: Combination Regimens

Brain tumors: Bevacizumab-Irinotecan (Glioblastoma)

Colorectal cancer:

Bevacizumab-Irinotecan-Fluorouracil-Leucovorin

Cetuximab (Biweekly)-Irinotecan

Cetuximab-Irinotecan

Fluorouracil-Leucovorin-Irinotecan (Saltz Regimen)

FOIL

FU-LV-CPT-11

Esophageal cancer: Irinotecan-Cisplatin (Esophageal Cancer)

Lung cancer (small cell): Cisplatin-Irinotecan (Small Cell Lung Cancer)

Pancreatic cancer: Gemcitabine-Irinotecan

Calculations

- Body Surface Area: Adults

Administration: I.VI.V. infusion, usually over 90 minutes.
Administration: I.V. DetailpH: 3-3.8
Dietary ConsiderationsContains sorbitol; do not use in patients with hereditary fructose intolerance.
StorageStore intact vials of injection at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light. Solutions diluted in NS may precipitate if refrigerated. Solutions diluted in D_5W are stable for 24 hours at room temperature or 48 hours under refrigeration at 2°C to 8°C. Do not freeze.
ReconstitutionDilute in 250-500 mL D_5W or NS to a final concentration of 0.12-2.8 mg/mL. Due to the relatively acidic pH, irinotecan appears to be more stable in D_5W than NS.
CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Leucovorin; **Incompatible:** Gemcitabine.

Compatibility when admixed: Incompatible: Methylprednisolone sodium succinate.

ContraindicationsHypersensitivity to irinotecan or any component of the formulation; concurrent use of ketoconazole, St John's wort
Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.

- Diarrhea: See “Concerns related to adverse effects” below.

- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause severe myelosuppression.** Deaths due to sepsis following severe myelosuppression have been reported. Therapy should be temporarily discontinued if neutropenic fever occurs or if the absolute neutrophil count is <1000/mm^3. The dose of irinotecan should be reduced if there is a clinically significant decrease in the total WBC (<200/mm^3), neutrophil count (<1500/mm^3), hemoglobin (<8 g/dL), or platelet count (<100,000/mm^3). Routine administration of a colony-stimulating factor is generally not necessary, but may be considered for patients experiencing significant neutropenia.

- Colitis: Colitis, complicated by ulceration, bleeding, ileus, and infection has been reported.

- Diarrhea: **[U.S. Boxed Warning]: Severe diarrhea may be dose-limiting and potentially fatal; two severe (life-threatening) forms of diarrhea may occur.** Early diarrhea occurs during or within 24 hours of receiving irinotecan and is characterized by cholinergic symptoms (eg, increased salivation, diaphoresis, abdominal cramping); it is usually responsive to atropine. Late diarrhea occurs more than 24 hours after treatment which may lead to dehydration, electrolyte imbalance, or sepsis; it should be promptly treated with loperamide. Patients with diarrhea should be carefully monitored and treated promptly.

- Hypersensitivity reactions: Severe hypersensitivity reactions have occurred.

- Renal toxicity: Renal impairment and acute renal failure have been reported, possibly due to dehydration secondary to diarrhea.

Disease-related concerns:

- Bowel obstruction: Patients with bowel obstruction should not be treated with irinotecan until resolution of obstruction.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hyperbilirubinemia: Patients with even modest elevations in total serum bilirubin levels (1-2 mg/dL) have a significantly greater likelihood of experiencing first-course grade 3 or 4 neutropenia than those with bilirubin levels that were <1 mg/dL. Patients with abnormal glucuronidation of bilirubin, such as those with Gilbert's syndrome, may also be at greater risk of myelosuppression when receiving therapy with irinotecan. Use caution when treating patients with known hepatic dysfunction or hyperbilirubinemia; dosage adjustments should be considered.

Special populations:

- Elderly: Use with caution in elderly patients with comorbid conditions, or baseline performance status of 2; close monitoring and dosage adjustments are recommended.

- Patients homozygous/heterozygous for the UGT1A1*28 allele: Patients homozygous for the UGT1A1*28 allele are at increased risk of neutropenia; initial one-level dose reduction should be considered for both single-agent and combination regimens. Heterozygous carriers of the UGT1A1*28 allele may also be at increased risk; however, most patients have tolerated normal starting doses.

- Pelvic/abdominal radiation recipients: Use with caution in patients who have previously received pelvic/abdominal radiation.

Dosage form specific issues:

- Sorbitol: Product contains sorbitol; do not use in patients with hereditary fructose intolerance.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

- Appropriate use: Except as part of a clinical trial, use in combination with the fluorouracil and leucovorin “Mayo Clinic” regimen is not recommended. Increased toxicity has also been noted in patients with a baseline performance status of 2 in other combination regimens containing irinotecan, leucovorin, and fluorouracil.

Pregnancy Risk FactorD
Pregnancy ConsiderationsTeratogenic effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant while receiving treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse ReactionsFrequency of adverse reactions reported for single-agent use of irinotecan only.

>10%:

Cardiovascular: Vasodilation (9% to 11%)

Central nervous system: Cholinergic toxicity (47% - includes rhinitis, increased salivation, miosis, lacrimation, diaphoresis, flushing and intestinal hyperperistalsis); fever (44% to 45%), pain (23% to 24%), dizziness (15% to 21%), insomnia (19%), headache (17%), chills (14%)

Dermatologic: Alopecia (46% to 72%), rash (13% to 14%)

Endocrine & metabolic: Dehydration (15%)

Gastrointestinal: Diarrhea, late (83% to 88%; grade 3/4: 6% to 31%), diarrhea, early (43% to 51%; grade 3/4: 6% to 22%), nausea (70% to 86%), abdominal pain (57% to 68%), vomiting (62% to 67%), cramps (57%), anorexia (44% to 55%), constipation (30% to 32%), mucositis (30%), weight loss (30%), flatulence (12%), stomatitis (12%)

Hematologic: Anemia (60% to 97%; grades 3/4: 5% to 22%), leukopenia (63% to 96%, grades 3/4: 14% to 28%), thrombocytopenia (96%, grades 3/4: 1% to 4%), neutropenia (30% to 96%; grades 3/4: 14% to 31%)

Hepatic: Bilirubin increased (84%), alkaline phosphatase increased (13%)

Neuromuscular & skeletal: Weakness (69% to 76%), back pain (14%)

Respiratory: Dyspnea (22%), cough (17% to 20%), rhinitis (16%)

Miscellaneous: Diaphoresis (16%), infection (14%)

1% to 10%:

Cardiovascular: Edema (10%), hypotension (6%), thromboembolic events (5%)

Central nervous system: Somnolence (9%), confusion (3%)

Gastrointestinal: Abdominal fullness (10%), dyspepsia (10%)

Hematologic: Neutropenic fever (grades 3/4: 2% to 6%), hemorrhage (grades 3/4: 1% to 5%), neutropenic infection (grades 3/4: 1% to 2%)

Hepatic: AST increased (10%), ascites and/or jaundice (grades 3/4: 9%)

Respiratory: Pneumonia (4%)

<1%, postmarketing, and/or case reports: ALT increased, amylase increased, anaphylactoid reaction, anaphylaxis, angina, arterial thrombosis, bleeding, bradycardia, cardiac arrest, cerebral infarct, cerebrovascular accident, circulatory failure, colitis, deep thrombophlebitis, dysrhythmia, embolus, gastrointestinal bleeding, gastrointestinal obstruction, hepatomegaly, hiccups, hyperglycemia, hypersensitivity, hyponatremia, ileus, interstitial lung disease, intestinal perforation, ischemic colitis, lipase increased, lymphocytopenia, megacolon, MI, muscle cramps, myocardial ischemia, pancreatitis, paresthesia, peripheral vascular disorder, pulmonary embolus; pulmonary toxicity (dyspnea, fever, reticulonodular infiltrates on chest x-ray); renal failure (acute), renal impairment, syncope, thrombophlebitis, thrombosis, typhlitis, ulceration, ulcerative colitis, vertigo

Note: In limited pediatric experience, dehydration (often associated with severe hypokalemia and hyponatremia) was among the most significant grade 3/4 adverse events, with a frequency up to 29%. In addition, grade 3/4 infection was reported in 24%.

Oncology: VesicantNo

Oncology: Emetic PotentialModerate-to-high (30% to 90%)

Metabolism/Transport Effects**Substrate** (major) of CYP2B6, 3A4

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*
